Prevalence of Diagnosed & Undiagnosed Diabetes by Age , NHANES 1999 - 2002

Model for age – related hyperglycemia

Diabetic Risk Factors in Aging

Decreased physical activity

Increased adiposity

Age effect on Insulin action

Medications

Genetics

Coexisting illness

- Decreased age – related beta cell mass
- Increased pancreated islet amylin deposition
- Decreased beta cell sensitivity to glucose
 - Decreased beta cell sensitivity to gut incretin hormones

Insulin Resistance

Decreased Insulin Secretion

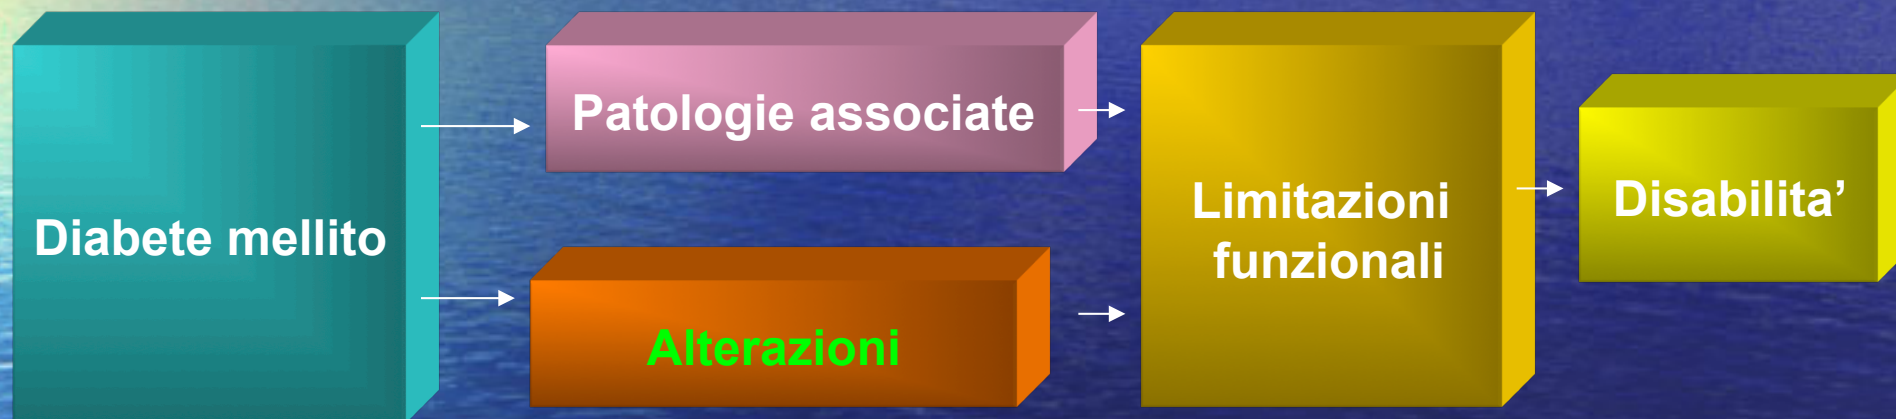

Impaired adaptation :
no ↑ insulin

Progression
to IGT and
type 2 diabetes

Il diabete mellito come fattore di rischio di disabilita' nel soggetto anziano

Cardiopatia ischemica , scompenso cardiaco, arteriopatia degli arti inferiori , ipertensione , obesita' , artrosi .

- acuita' visiva
- sensibilita' periferica
- forza muscolare
- declino cognitivo

- velocita' di marcia
 - equilibrio
 - alzarsi

Therapeutic Regimens

DRUGS:

glimepiride

repaglinide

metformin

rosiglitazone

acarbose

glargine,

NPH and premixed insulins

Aspart and regular insulin

WEIGHT
GAIN

HYPO
GLYCEMIA

Fattori che predispongono i pazienti anziani diabetici alla ipoglicemia

Scorretto o inadeguato apporto alimentare

Compromissione dello stato cognitivo

Politerapia e scarsa adesione agli schemi terapeutici

Difficolta' a correggere precocemente le ipoglicemie

Insufficienza epatica / renale

**Comorbilita' che mascherano o confondono i sintomi
(demenza , depressione , disturbi del sonno etc.)**

Hypoglycemic Episodes and Risk of Dementia in Older Patients With Type 2 Diabetes Mellitus

Rachel A. Whitmer , Andrew J. Karter , Kristine Yaffe , Charles P. Quesenberry ,
Joseph V. Selby .

JAMA 2009; (15) : 1565 - 1572

Table 3. Hypoglycemia and Risk of Incident Dementia^a

No. of Hypoglycemic Episodes ^b	No. of Dementia Cases	Hazard Ratio (95% Confidence Interval)		
		Adjusted for Age (as Time Scale), BMI, Race/Ethnicity, Education, Sex, and Duration of Diabetes	Additionally Adjusted for Comorbidities ^c	Additionally Adjusted for 7-Year Mean HbA _{1c} Level, Diabetes Treatment, and Years of Insulin Use
1 or more	250	1.68 (1.47-1.93)	1.48 (1.29-1.70)	1.44 (1.25-1.66)
1	150	1.45 (1.23-1.72)	1.29 (1.10-1.53)	1.26 (1.10-1.49)
2	57	2.15 (1.64-2.81)	1.86 (1.42-2.43)	1.80 (1.37-2.36)
3 or more	43	2.60 (1.78-3.79)	2.10 (1.48-2.73)	1.94 (1.42-2.64)

Abbreviations: BMI, body mass index; HbA_{1c}, glycated hemoglobin.

^aAnalyses combined using Cox proportional hazard models.

^bThe 1 or more group was compared to 0 and 1, 2, and 3 or more groups were simultaneously compared to 0.

^cAdjustment made using a comorbidity composite scale.

Conclusion : Among older patients with type 2 diabetes , a history of severe hypoglycemic episodes was associated with a greater risk of dementia .
Whether minor hypoglycemic episodes increase risk of dementia .

Older Patients Need Individualized Care

American Diabetes Association recommends less aggressive target goals for older patients with advanced complications, comorbid illness, cognitive, or functional impairment

FBG 140 mg/dL (vs 90-130 mg/dL)

Postprandial 200-220 mg/dL (vs <180mg/dL)

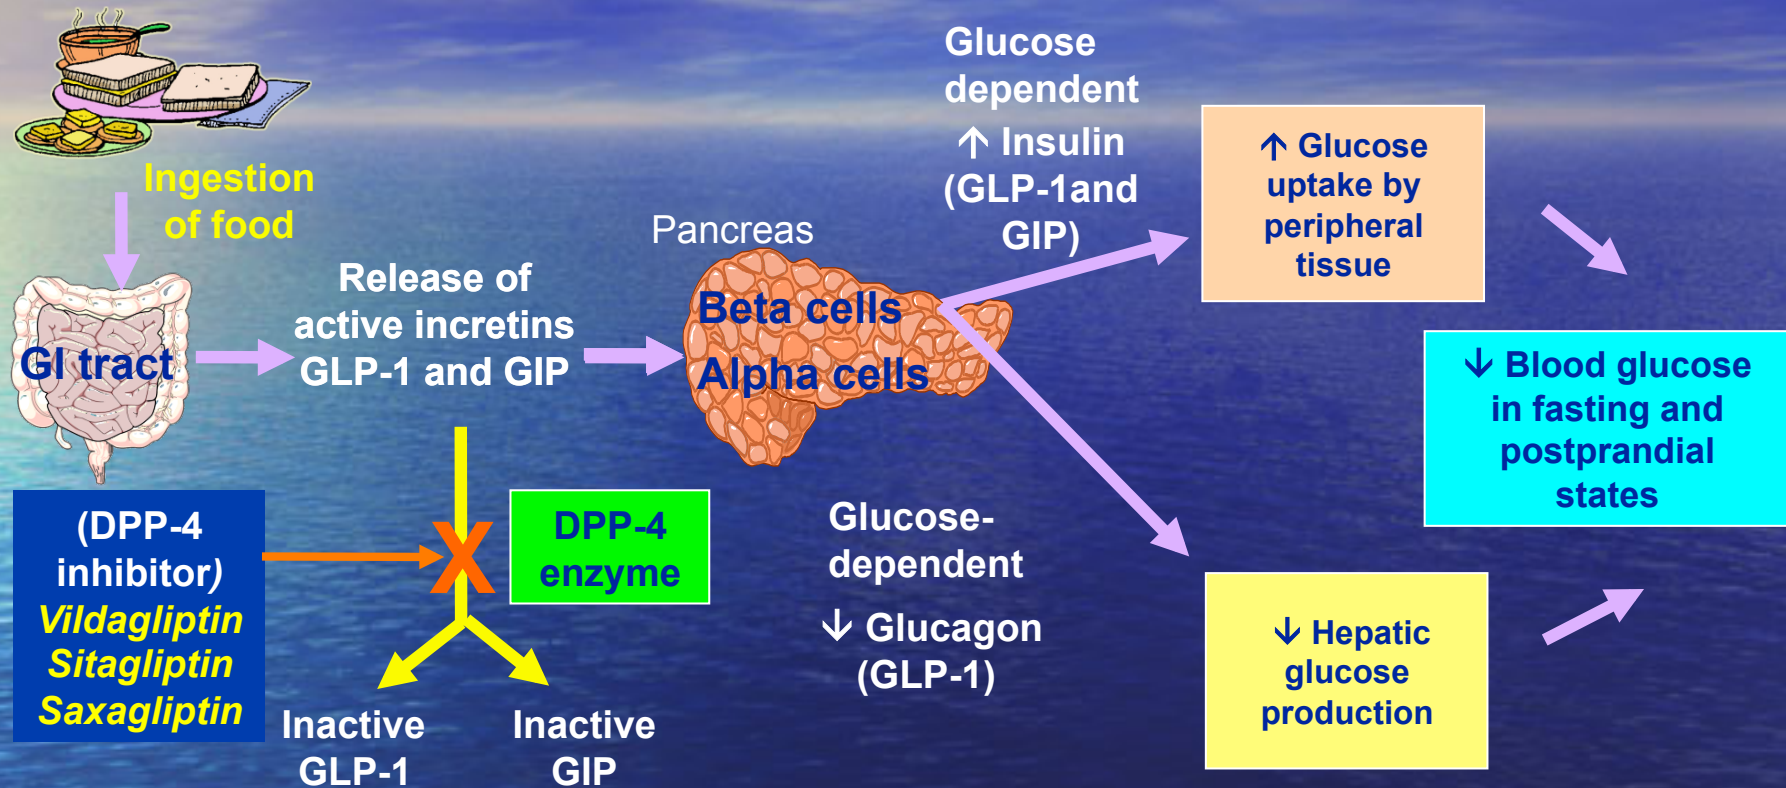

American Geriatric Society (AGS) recommends less stringent A1c if **life expectancy less than 5 yrs**

A1c 8%
BP140/80

but

A1c 7% reasonable, if relatively healthy and good functional status

Mechanism of Action of Incretin

Pleiotropic Actions of GLP-1

Pancreas

- ↑ Insulin synthesis and secretion
- ↑ Expression of β -cell genes
- ↑ β -cell proliferation/neogenesis
- ↓ β -cell apoptosis
- ↓ Glucagon secretion

Stomach and Intestine

- ↓ Gastric emptying
- ↓ Bowel motility

Liver

- ↑ Glucose uptake
- ↓ Glucose production

Endocrine System

- ↑ CRH-ACTH-cortisol axis
- ↑ GnRH-LH axis

Nervous System

- ↓ Appetite
- ↑ Satiety
- ↑ Neuronal cell proliferation/neogenesis
- ↑ Neuronal cell survival

Cardiovascular System

- ↑ Arterial blood pressure and heart rate
- ↑ Post-ischemic myocardial function
- ↑ Endothelial relaxation

Fat/Muscle

- ↑ Glucose uptake
- ↑ Lipogenesis
- ↑ Glycogen synthesis

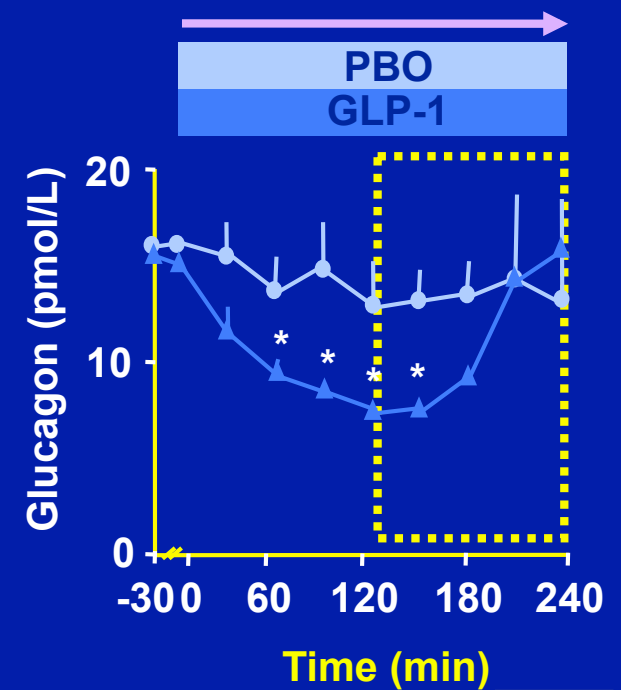

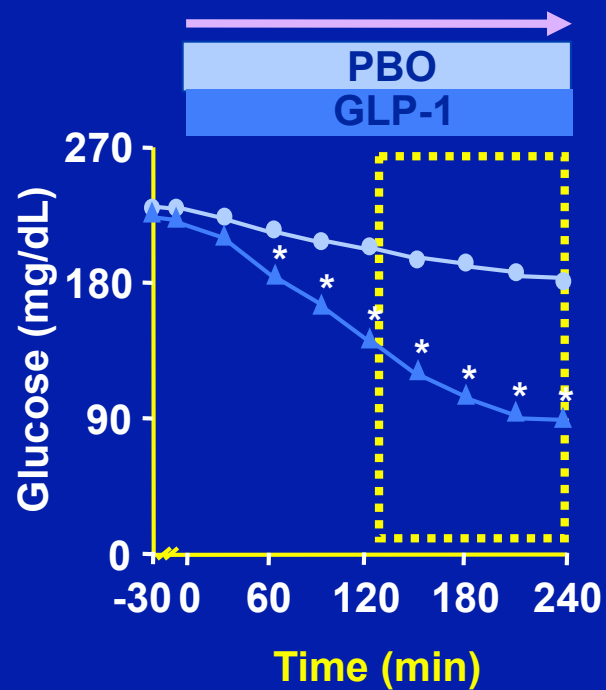

Lungs

- ↑ Surfactant production
- ↑ Arterial vasorelaxation

GLP-1 Effects Are Glucose Dependent in Type 2 Diabetes

● Placebo
▲ GLP-1

N = 10; Mean (SE); *P<0.05
Data from Nauck MA, et al. *Diabetologia*. 1993;36:741-744

Summary of Clinical Data

Efficacy and tolerability of **vildagliptin** monotherapy in drug – naive patients with type 2 diabetes .

Pi – Sunyer FX et al. **Diabetes Res Clin Pract** 2007 ; **76** : 132 - 138

Effects of **vildagliptin** on glucose control over 24 weeks in patients with type 2 diabetes inadequately controlled with metformin .

Bosi E. et al . **Diabetes Care** 2007 ; **30** : 890 - 895

Vildagliptin in combination with pioglitazone improves glycaemic control in patients with type 2 diabetes failing thiazolidinedione monotherapy : a randomized , placebo – controlled study .

Garber AJ et al . **Diabetes Obes Metab** 2007 ; **9** : 166 - 174

Effects of **vildagliptin** on glucose control in patients with type 2 diabetes Inadequately controlled with a sulphonylurea .

Garber AJ. et al **Diabetes Obes Metab** 2008 ; **10** : 1047 - 1056

Addition of **vildagliptin** to insulin improves glycaemic control in type 2 diabetes.

Fonseca V. et al **Diabetologia** 2007 ; 50 : 1148 - 1155

Efficacia e tollerabilita' della **Vildagliptin** in un gruppo di pazienti anziani affetti da DM T2

Lo scopo dello studio e' stato quello di valutare la efficacia e la sicurezza della Vildagliptin vs Glimepride in pazienti anziani affetti da DM T2 in controllo inadeguato con Metformina

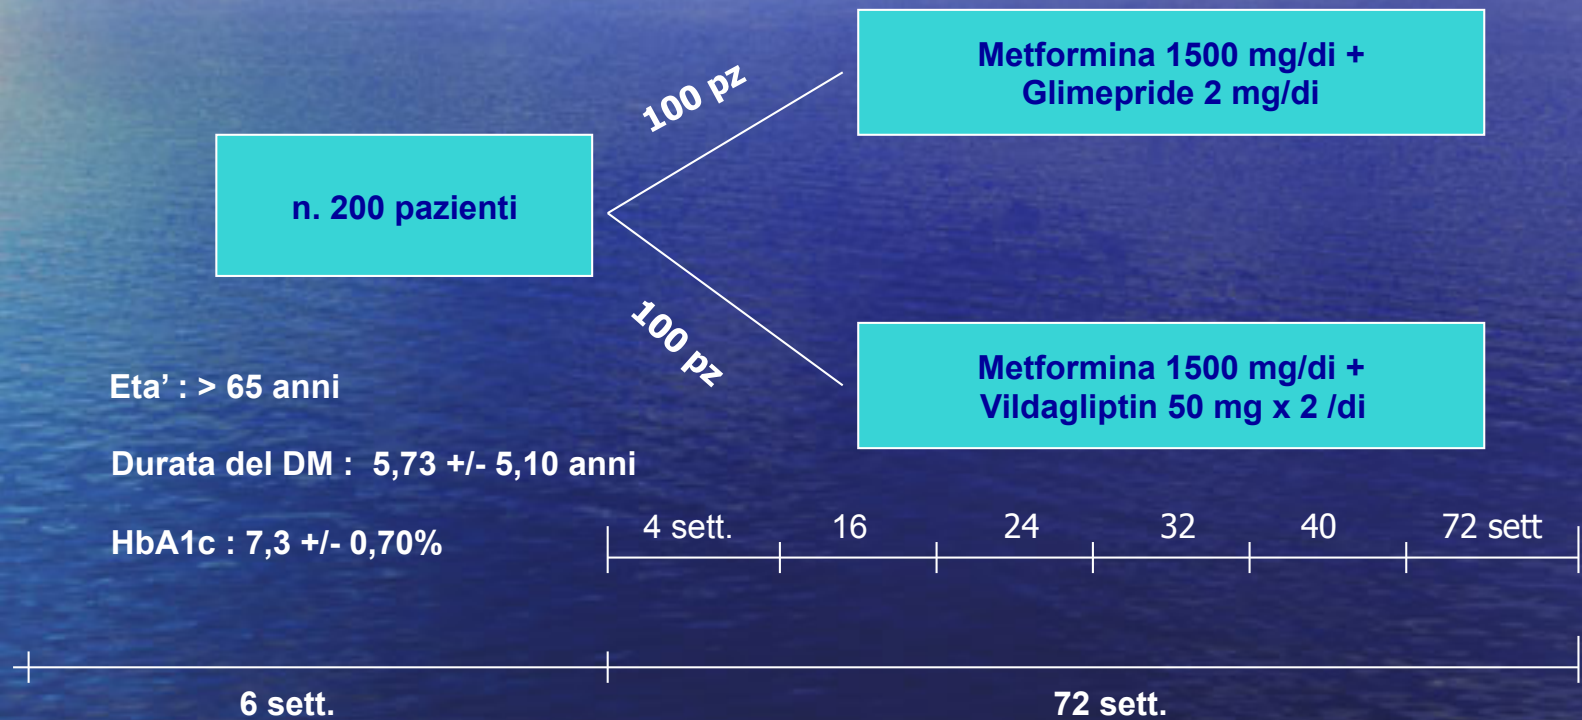

Disegno dello studio

M : 53,5 %
F : 46,5 %

Eta' : > 65 anni

Durata del DM : 5,73 +/- 5,10 anni

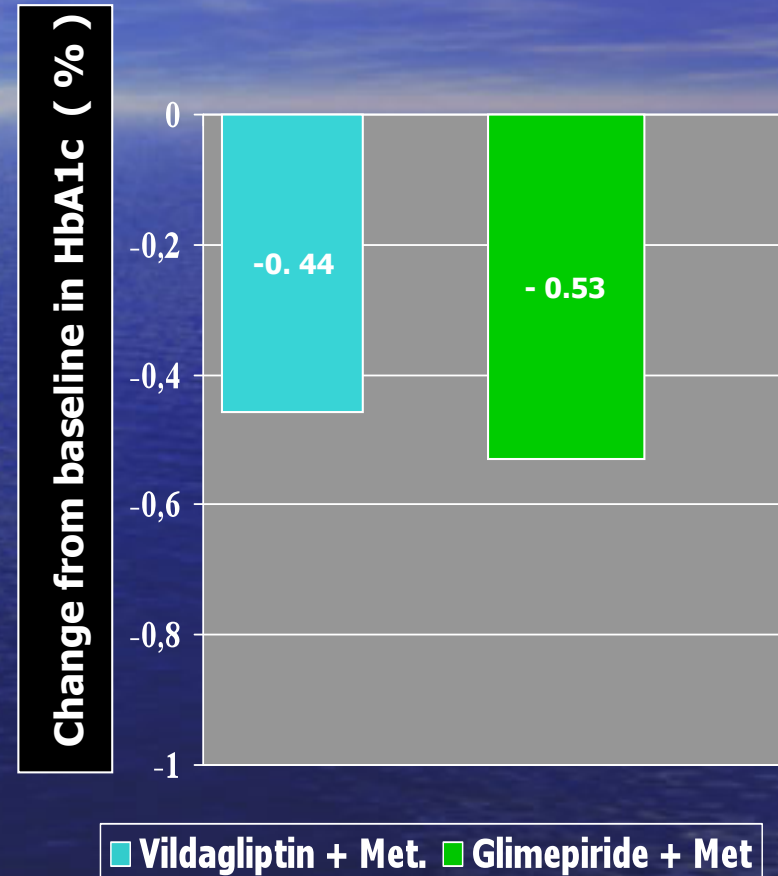

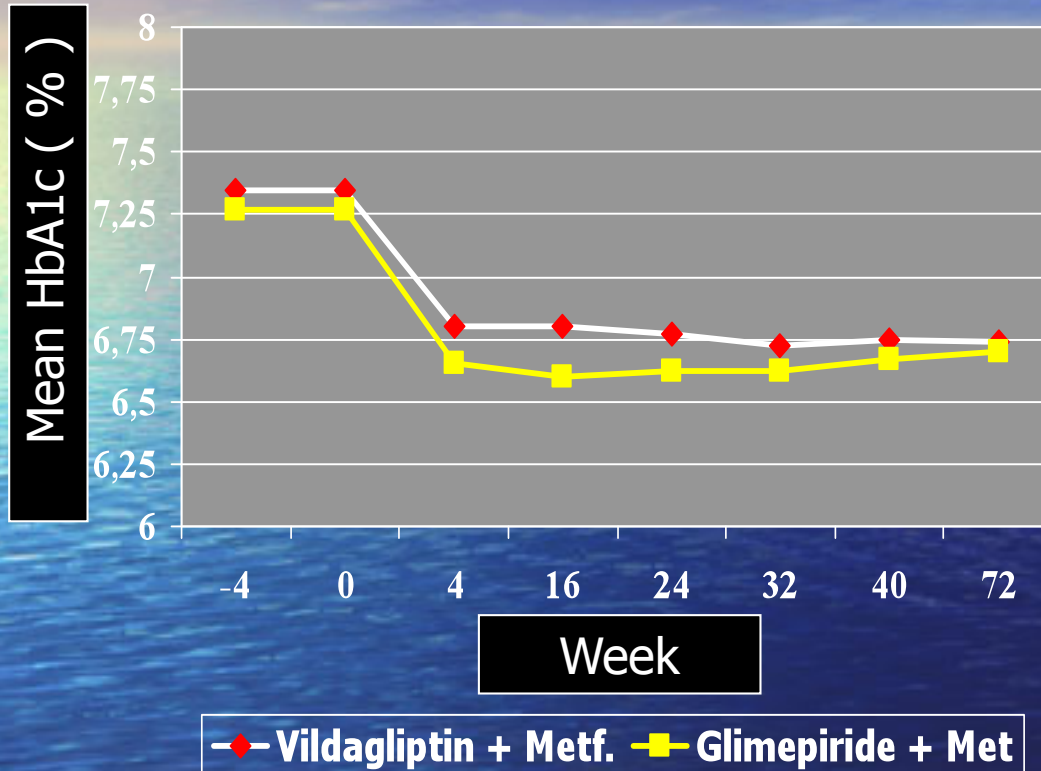

HbA1c : 7,3 +/- 0,70%

Caratteristiche della popolazione studiata

Parametri	Metformina +Glimepiride Gruppo A (n 100)	Metformina + Vildagliptin Gruppo B (n 100)
Anni	> 65 anni	> 65 anni
Maschi n %	53 %	54 %
Femmine n %	47 %	46 %
BMI kg/m2	31.80 +/- 5.27	31.69 +/- 5.25
Durata del Diabete (anni)	5.71 +/- 5.18	5.75 +/- 5.03
HbA1c %	7.31 +/- 0.70	7.30 +/- 0.70
FPG mg/dl	165 +/- 41	165 +/- 40
GFR : 60 – 90 ml/ min /1,73 m2	45 %	43 %
GFR : 30 – 60 ml/ min / 1,73 m2	4.5 %	5 %
Ipertensione arteriosa	65 %	69 %

Variazione della HbA1c durante il follow - up

Variazioni della FPG e di Peso Corporeo al termine del follow – up

Gli effetti collaterali

CONCLUSIONI

La Vildagliptin (50 mg x 2/di) ha mostrato una non inferiorita' rispetto alla Glimepiride (2 mg/di) in termini di efficacia terapeutica accompagnandosi per di piu' ad una minore incidenza di episodi ipoglicemici e non determinando un incremento di peso .
La Vildagliptin rappresenta un valido approccio terapeutico in pazienti affetti da DM T2 non ben controllati con la sola Metformina e specie in quei pazienti anziani particolarmente suscettibili alla ipoglicemia .
