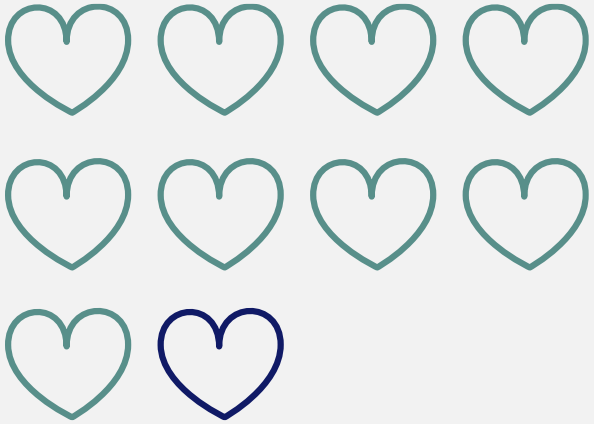
Impatto dei nuovi farmaci sugli aspetti cardio-renali

Dott. Olga Eugenia Disoteo

CAPTURE study shows the high incidence of CVD in people with T2D

The study found that **1/3 of people** with T2D have established cardiovascular disease[1]



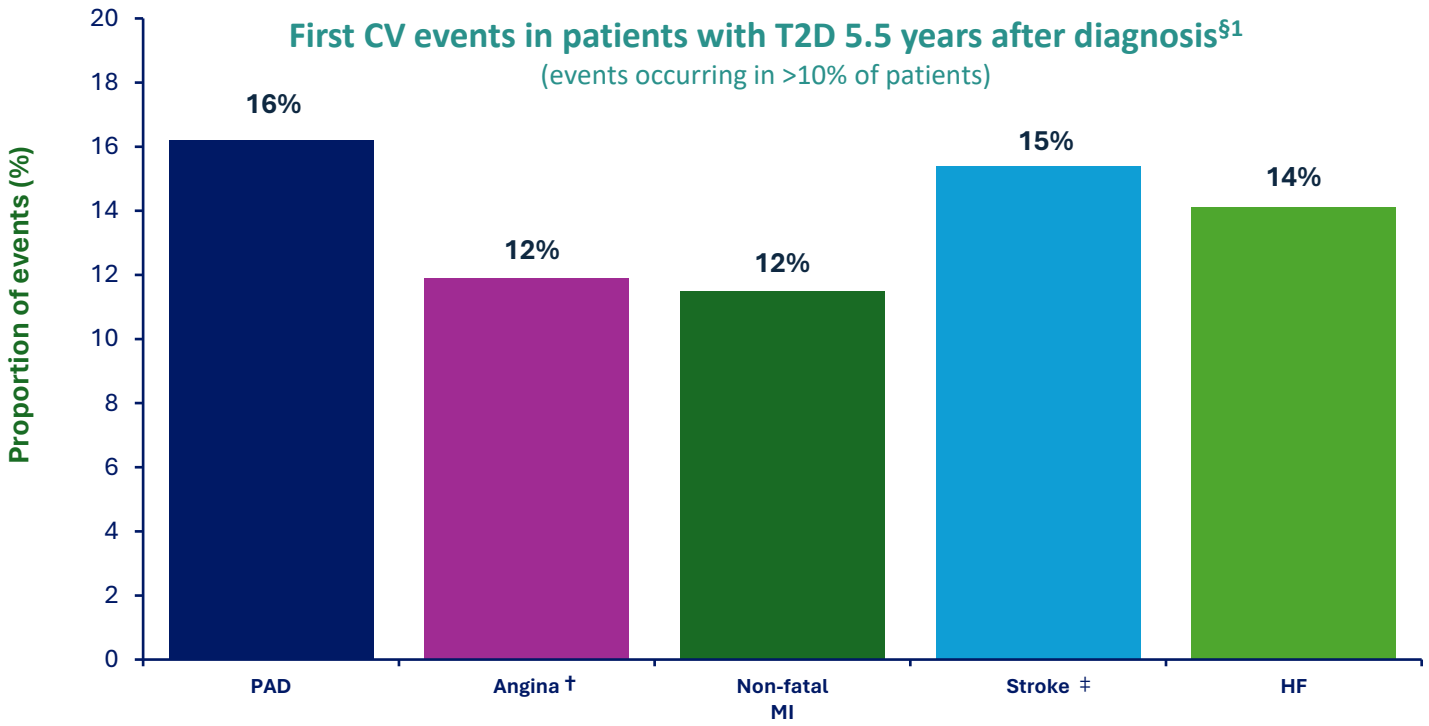
9/10 people with T2D and established CVD have ASCVD[1].

ASCVD, atherosclerotic cardiovascular disease; CVD, cardiovascular disease; T2D, type 2 diabetes.

1. Mosenzon O, et al. Cardiovasc Diabetol. 2021;20:154.

18% of people with T2D experience their first CV event within the first 5–6 years post diagnosis[1]

Cohort study of 34,198 patients with T2D*

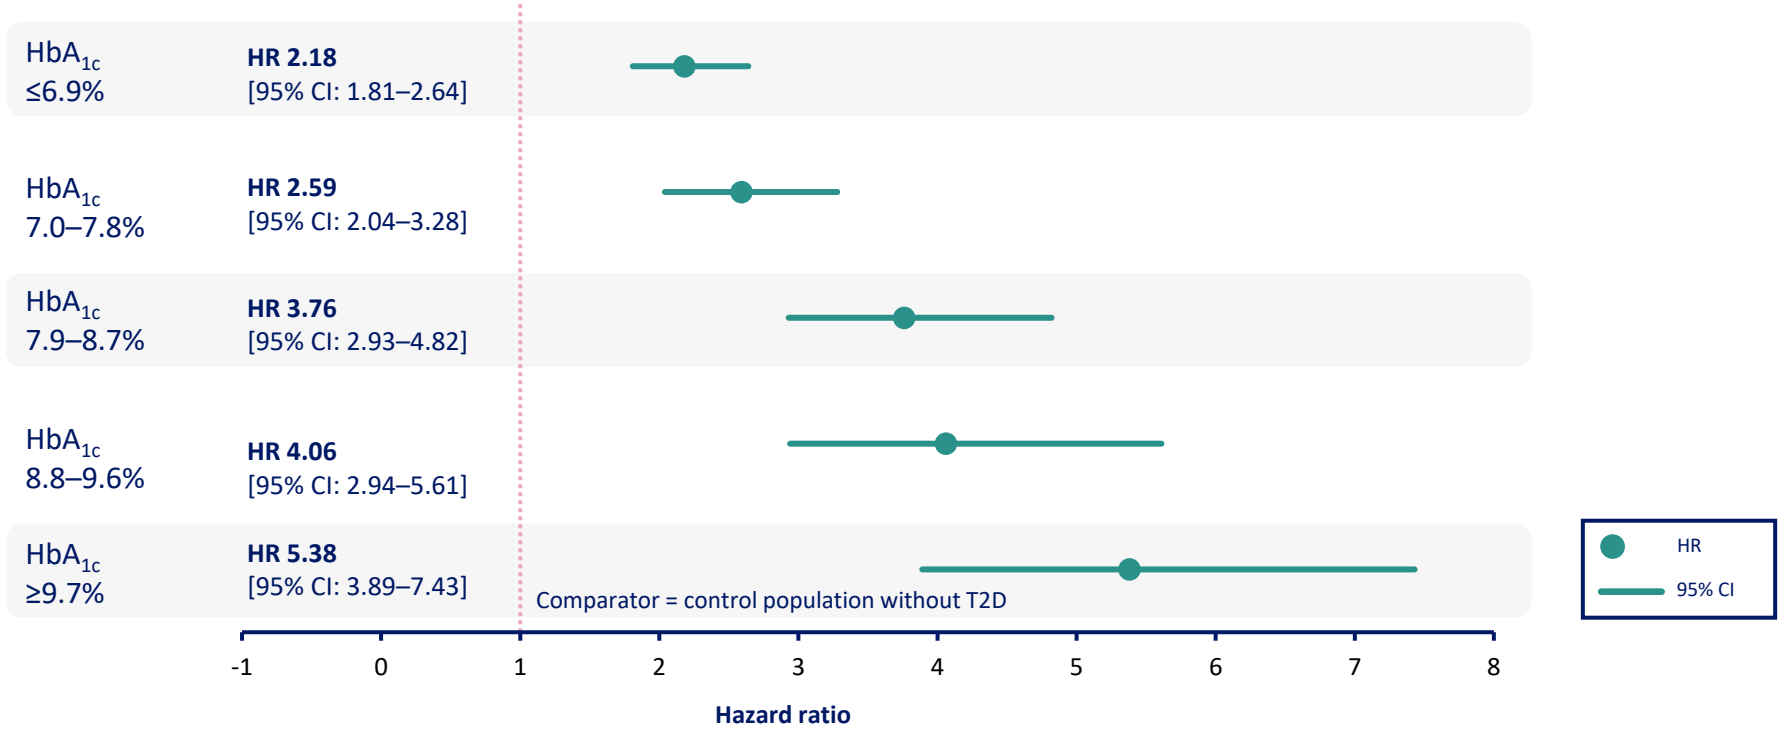


Heart attacks and strokes occur over **10 years earlier** in people with T2D than those without and will occur with greater severity[2,3]

CV, cardiovascular; HF, heart failure; MI, myocardial infarction; PAD, peripheral artery disease; T2D, type 2 diabetes; UK, United Kingdom.
**Full cohort including non-diabetic population ~1.9 million patients; †Includes stable and unstable angina; ‡Includes ischaemic stroke and stroke not further specified. §Results rounded up or down to nearest percentage point*
1. Shah AD et al. Lancet Diabetes Endocrinol 2015;3:105–113; 2. Low Wang CC et al. Circulation 2016;133:2459–2502; 3. Echouffo-Tcheugui JB et al. Eur Heart J 2018;39:2376–2386.

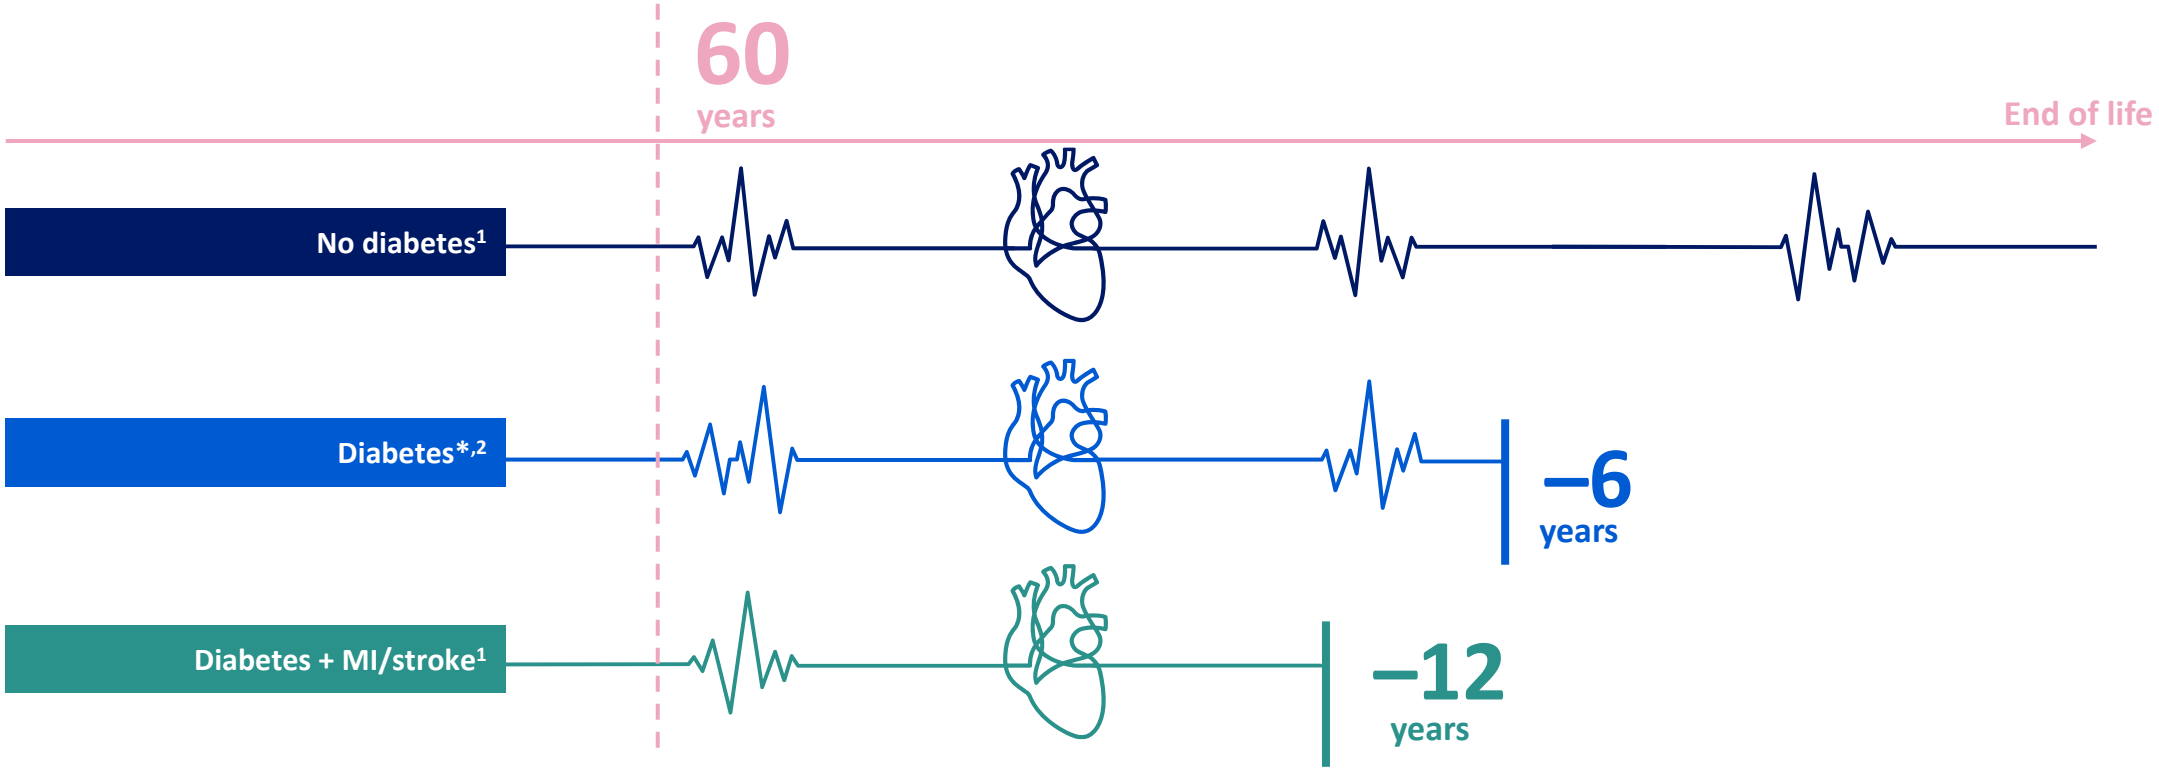
CV mortality risk increases with increasing HbA_{1c}

Association between T2D and CV mortality (<55 years), n = 78,086[1]



Data for people with T2D from the Swedish National Diabetes Register and controls without T2D matched for age, sex and county with 4.6 years mean follow-up.
Multivariate analysis, adjusting for various CVD risk factors.
ASCVD, atherosclerotic cardiovascular disease; CI, confidence interval; CVD, cardiovascular disease; HbA_{1c}, glycated haemoglobin; HR, hazard ratio; T2D, type 2 diabetes.
1. Tancredi M et al. N Engl J Med 2015;373:1720–1732.

Life expectancy is reduced by 12 years in people with diabetes with pre-existing ASCVD[1,2]

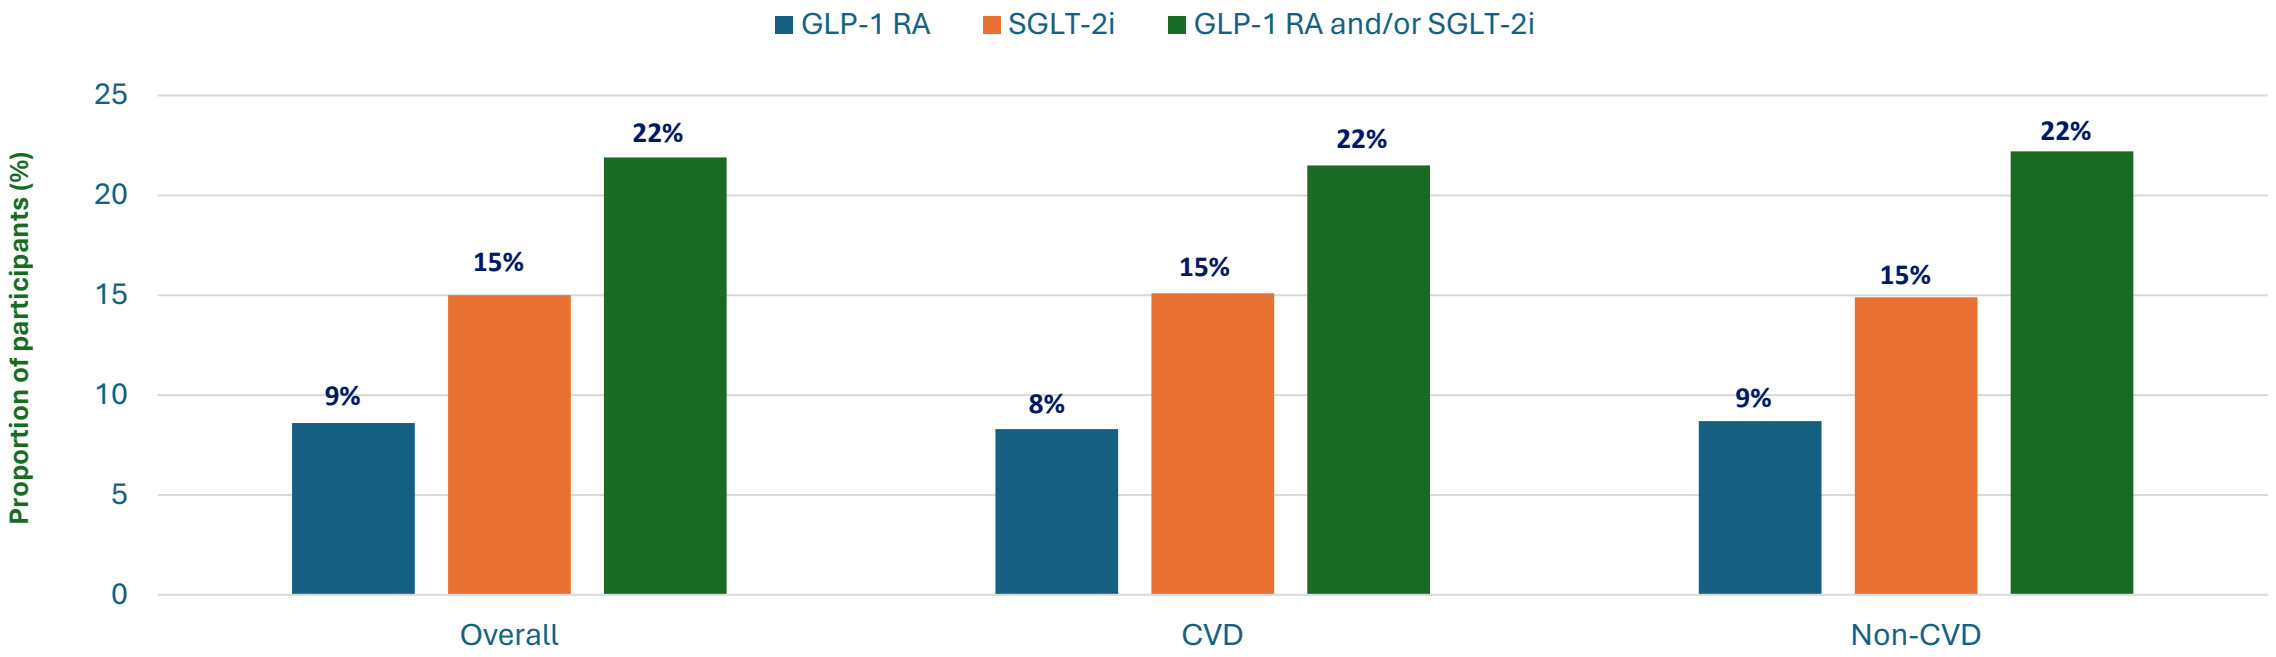


Early screening and further management of cardiovascular risk among younger and newly diagnosed people with T2D is required to protect them from the risk of stroke[1,2].

ASCVD, atherosclerotic cardiovascular disease; MI, myocardial infarction; T2D, type 2 diabetes.
**Diagnosed at age 45.*
1. Di Angelantonio E et al. JAMA 2015;314:52–60; 2. Sattar N et al. Circulation 2019;139:2228–2237.

Only 2 in 10 people with T2D and CVD or CV risk factors receive treatment proven to reduce the risk of ASCVD[1]

Use of glucose-lowering agents with demonstrated CV benefit[1].

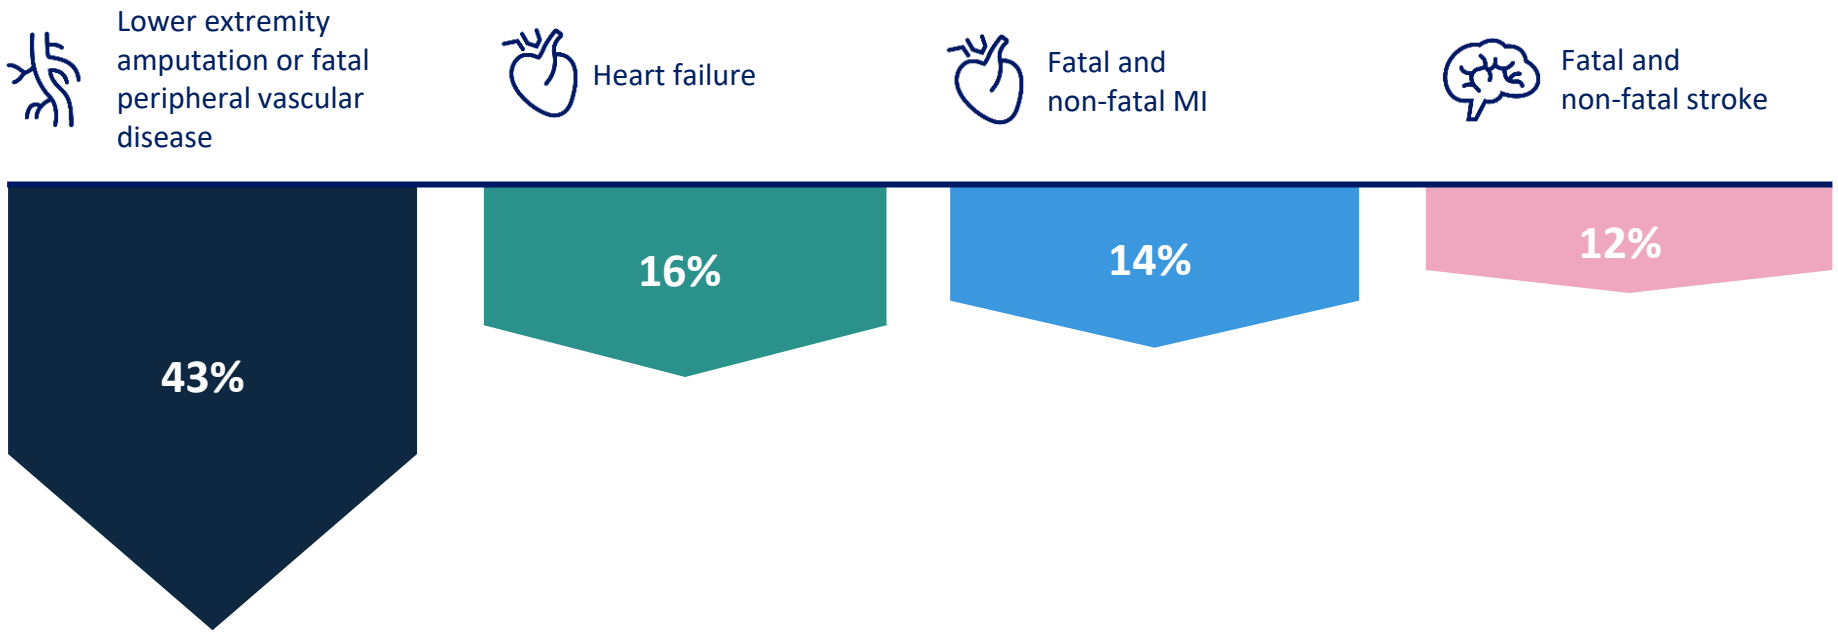


ASCVD, atherosclerotic cardiovascular disease; CV, cardiovascular; CVD, cardiovascular disease; GLP-1RA, glucagon-like peptide-1 receptor agonist; SGLT2i, sodium-glucose co-transporter-2 inhibitor; T2D, type 2 diabetes.
GLP-1RAs included dulaglutide, liraglutide and semaglutide; and SGLT2is: canagliflozin, dapagliflozin and empagliflozin.

1. Mosenzon O et al. Cardiovasc Diabetol 2021;20:154.

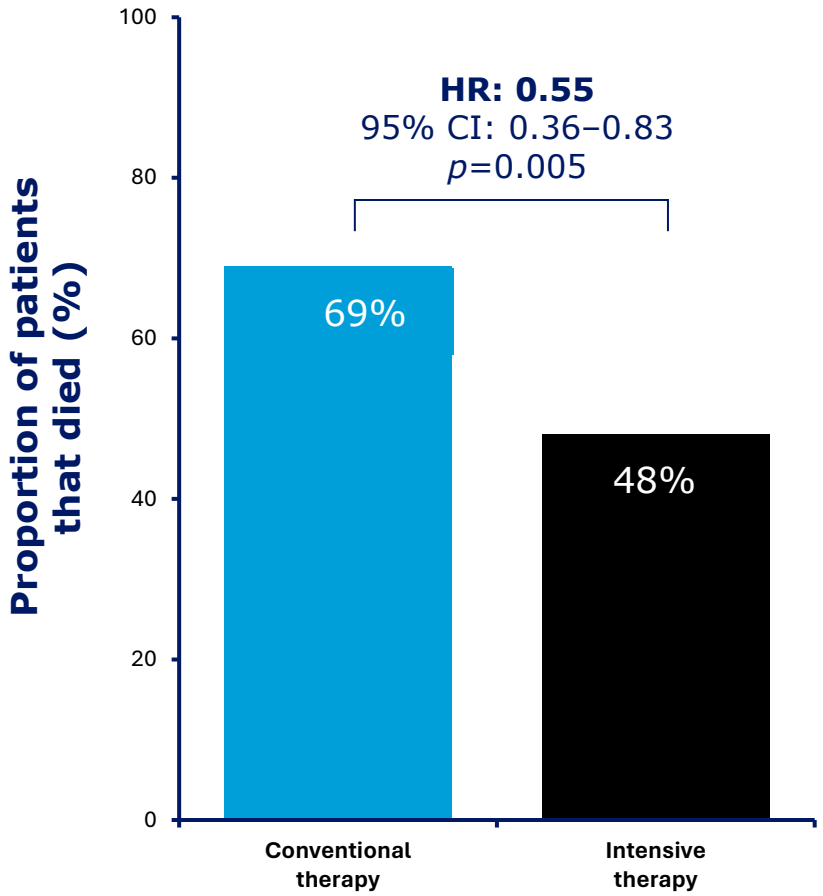
Better HbA1c control is associated with reductions in CV events

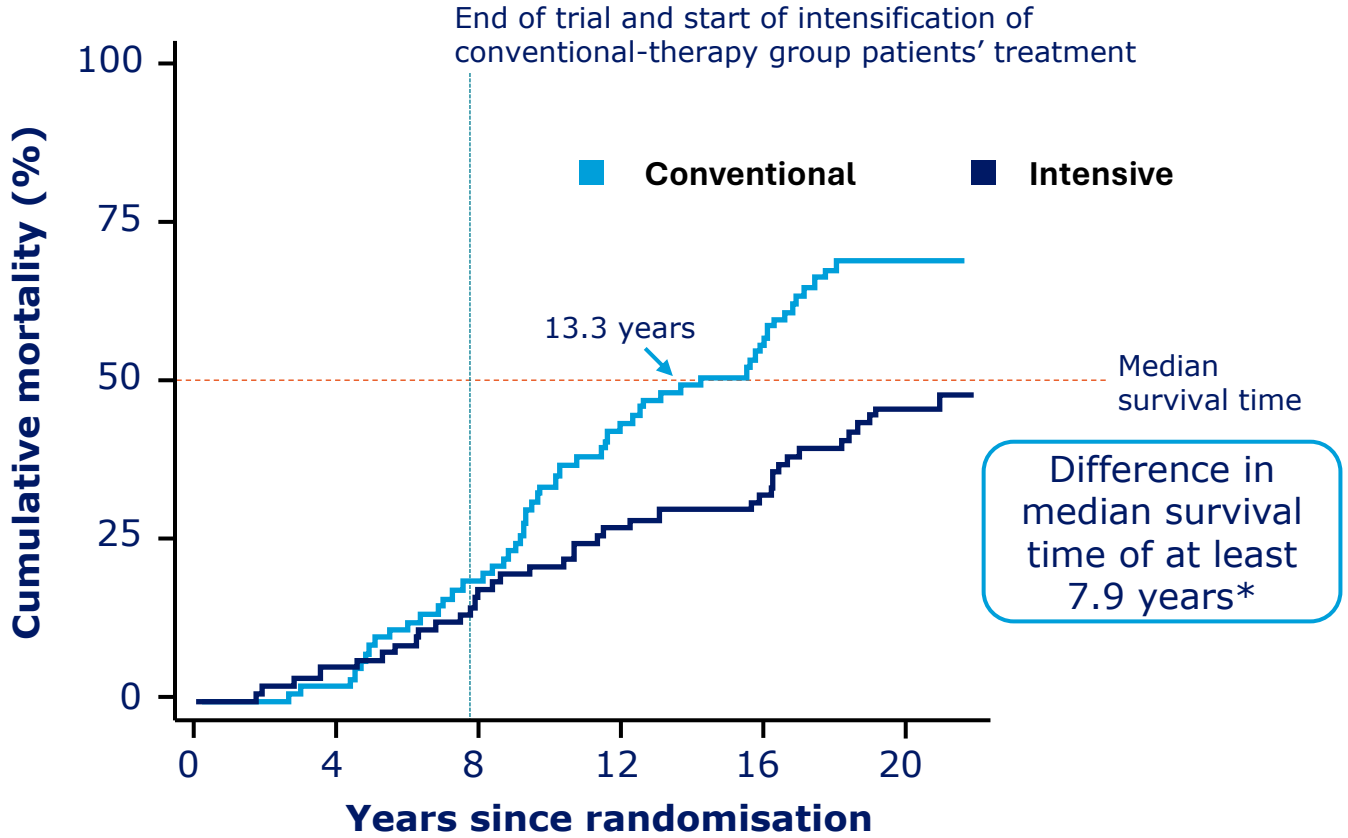
Every 1% drop in HbA_{1c} can reduce long-term diabetes complications[1]



CV, cardiovascular; HbA1c, glycated haemoglobin; MI, myocardial infarction.
1. Stratton IM, et al. BMJ. 2000; 321:405–412.

STENO-2: Mortality at 21 years' follow-up





Difference in median survival time of at least 7.9 years*

Patients at risk

Intensive	80	76	66	58	54	43
Conventional	80	78	65	45	34	24

*No formal calculation possible as <50% mortality in intensive therapy group. CI, confidence interval; HR, hazard ratio

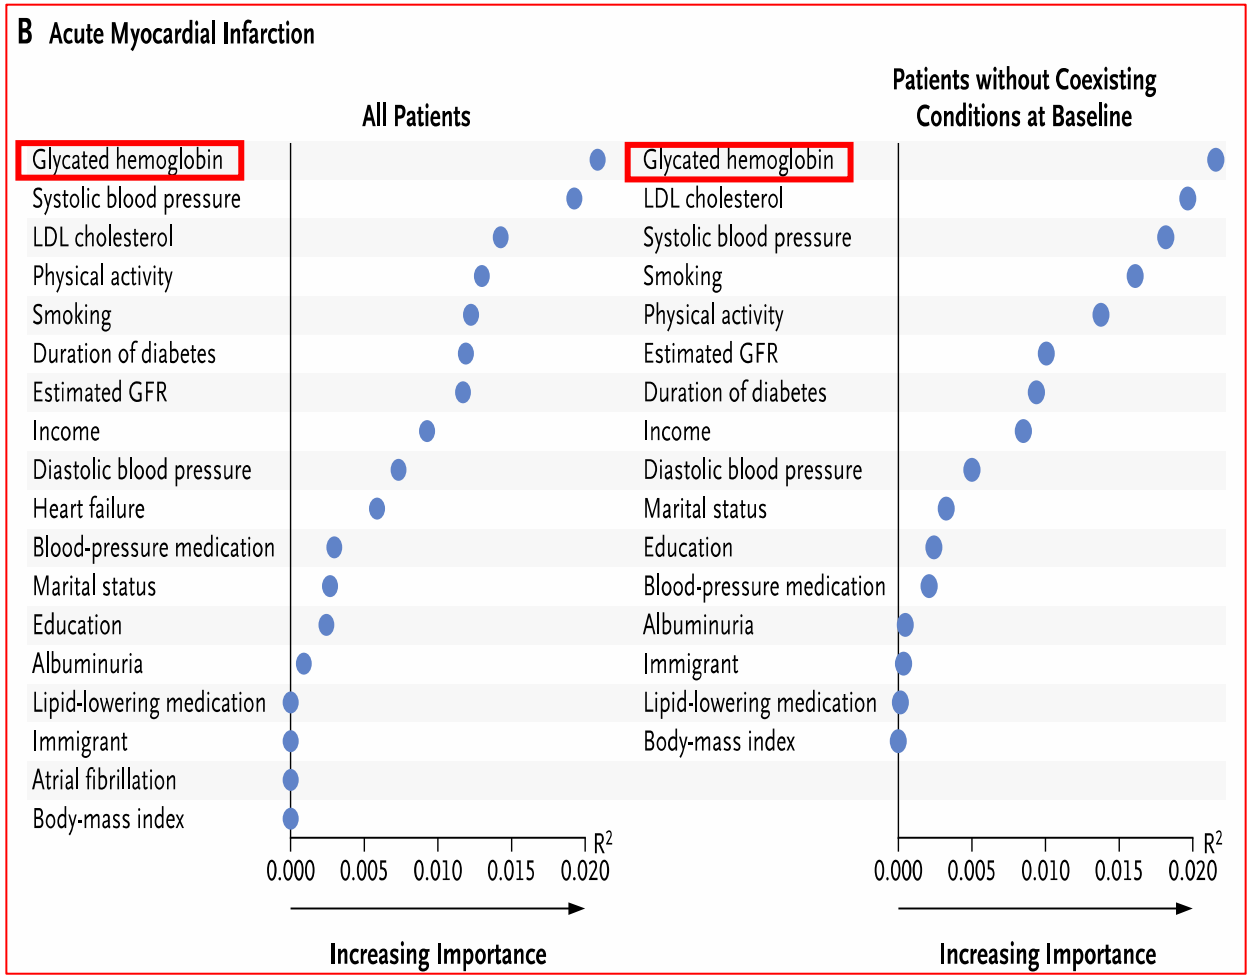
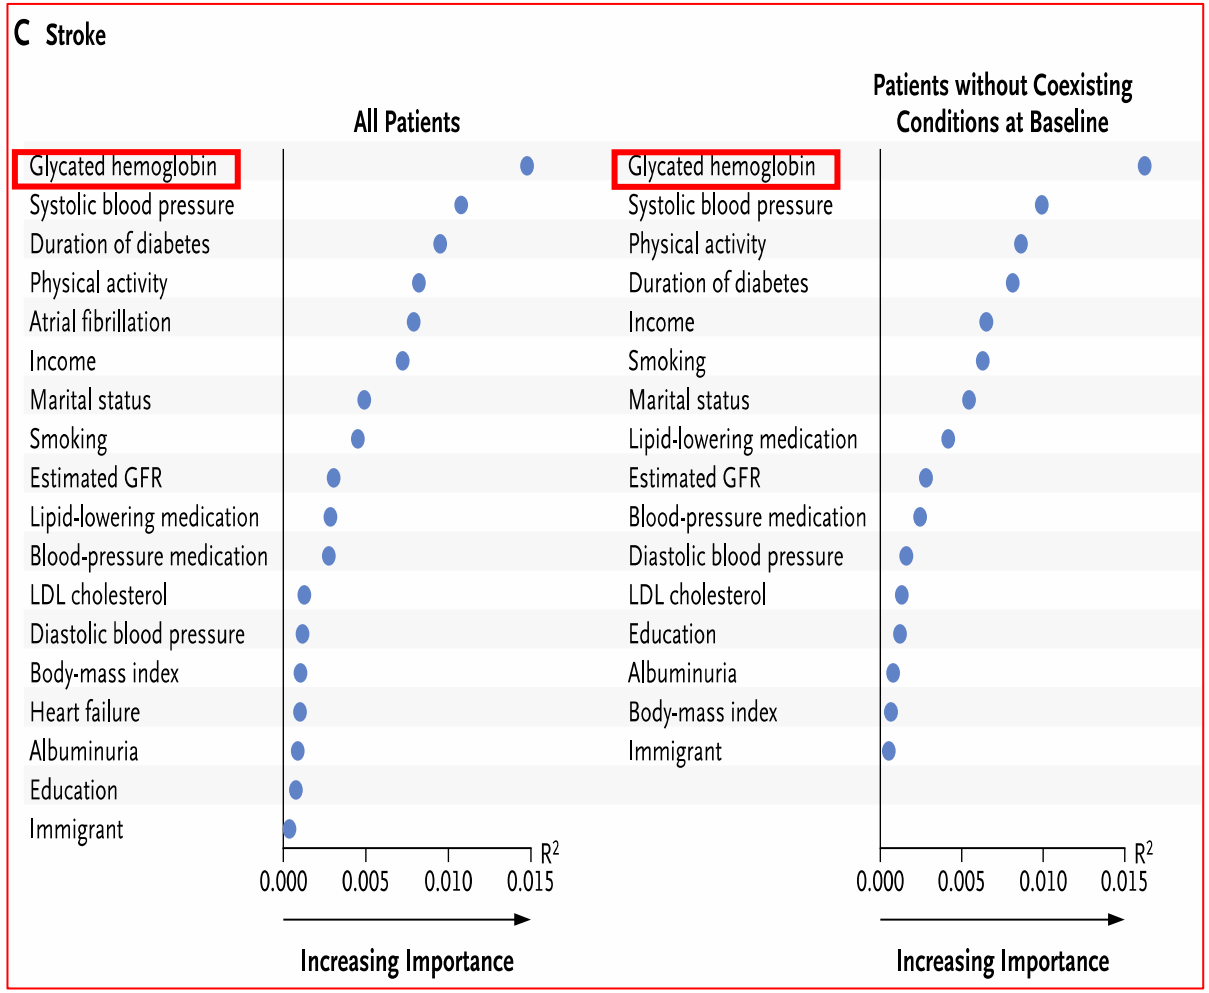
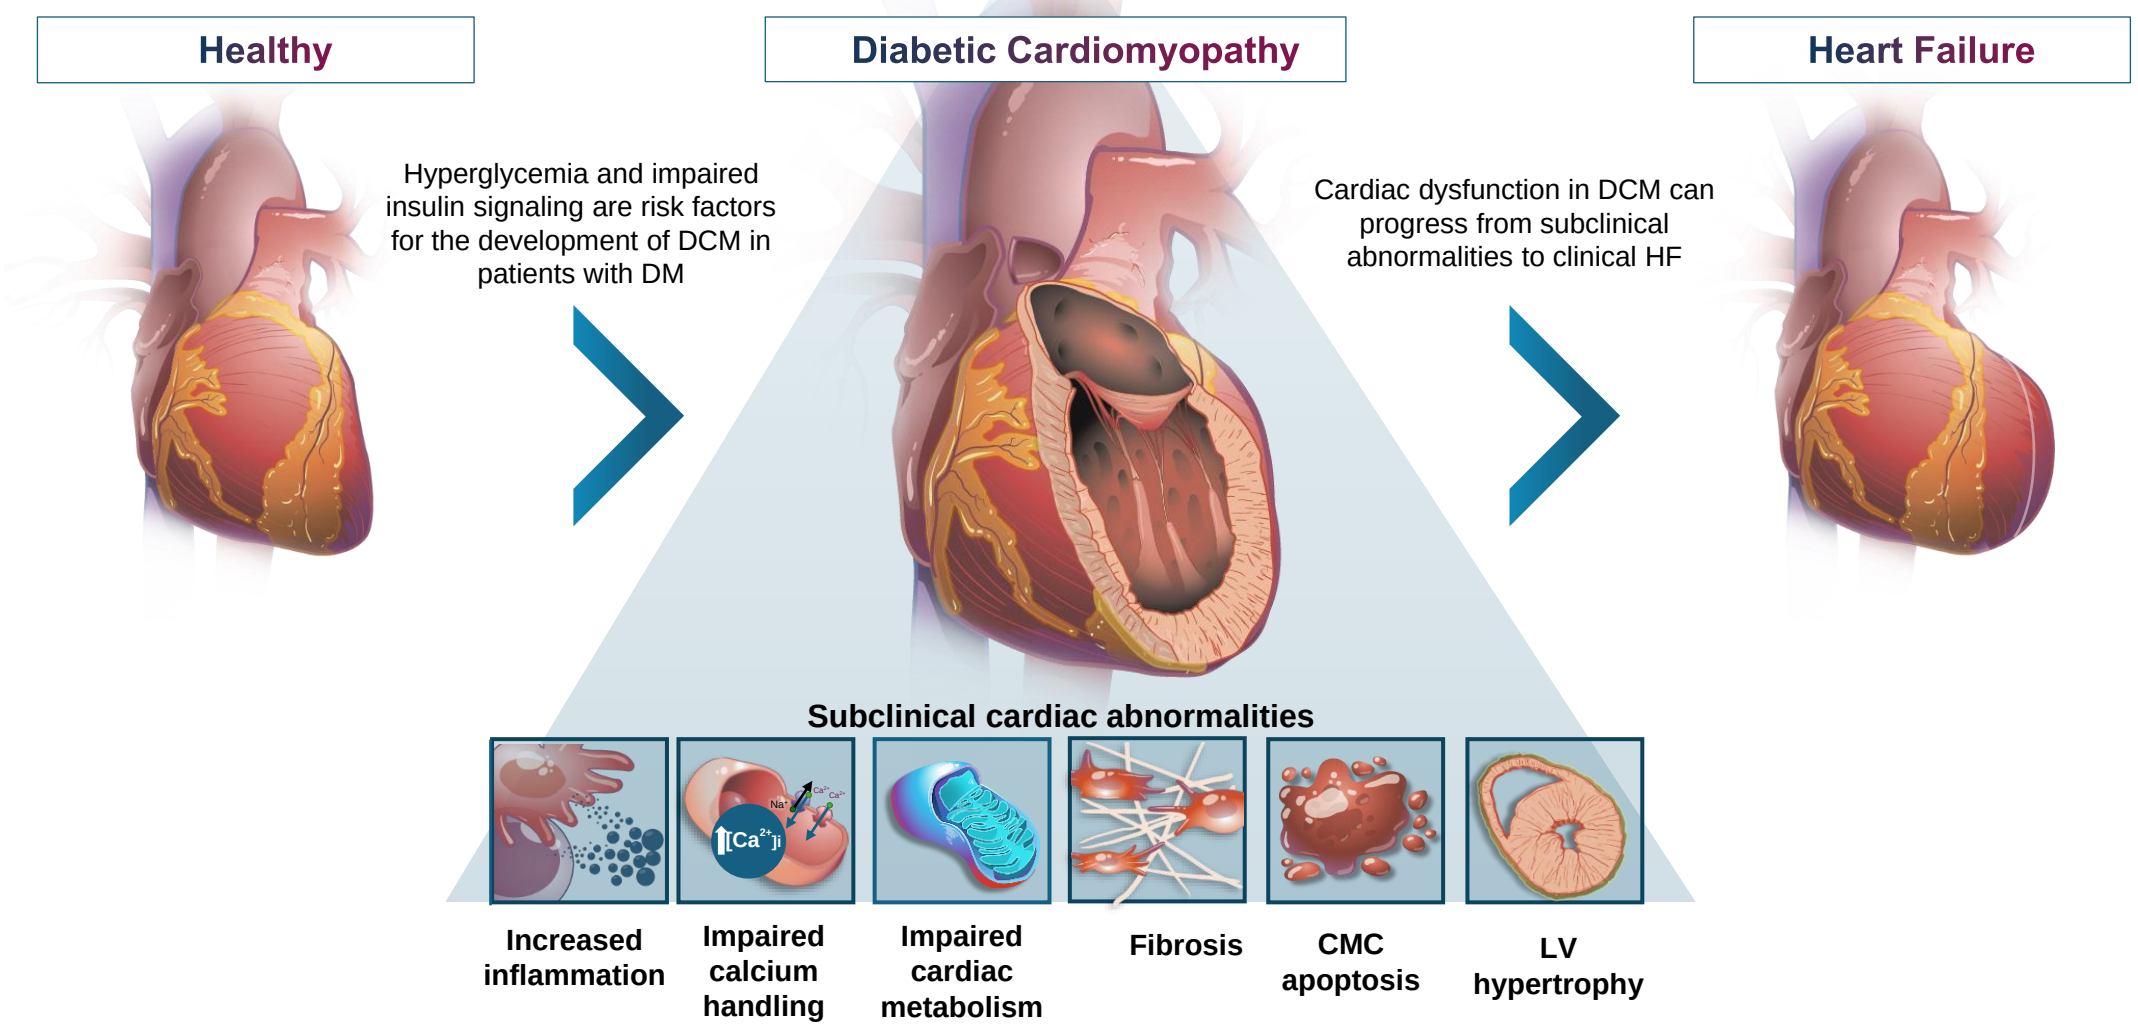
Rawshani A et al. *N Engl J Med* 2018;379:633–644

Risk Factors, Mortality, and Cardiovascular Outcomes in Patients with Type 2 Diabetes





Cardiac Abnormalities of Type 2 Diabetes Increase the Risk for Heart Failure

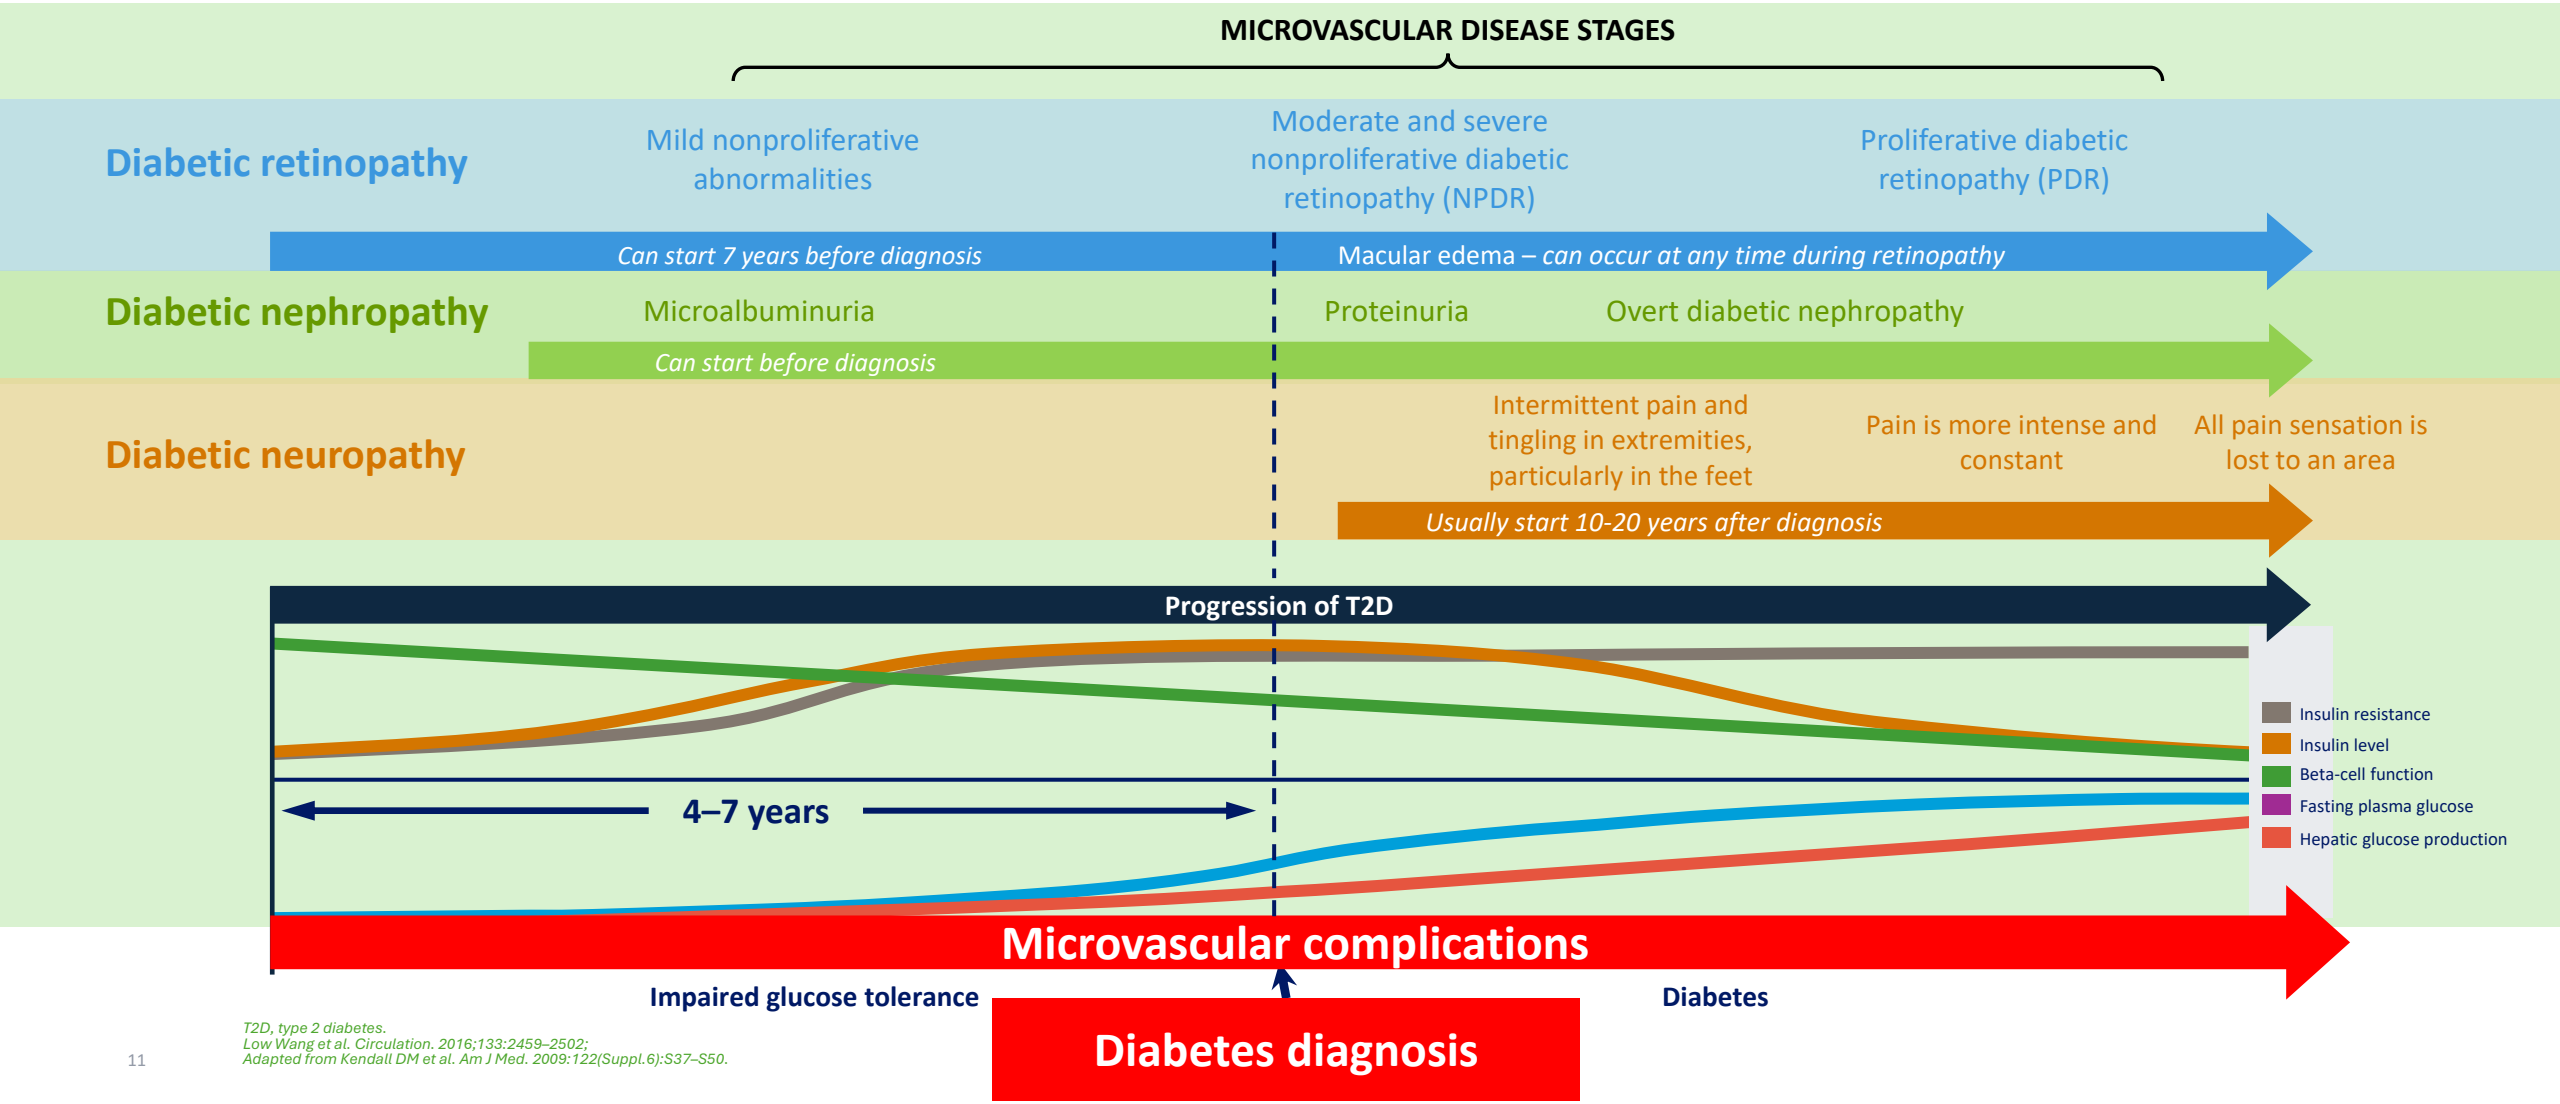


[Ca2+]i=intracellular calcium; CMC=cardiomyocyte; DCM=diabetic cardiomyopathy; DM=diabetes mellitus; HF=heat failure; LV=left ventricular.

Jia J et al. Circ Res. 2018;122(4):624-638.

Microvascular complications may predate T2D diagnosis

Timeline of microvascular disease in T2D



T2D, type 2 diabetes.
Low Wang et al. Circulation. 2016;133:2459–2502;
Adapted from Kendall DM et al. Am J Med. 2009:122(Suppl.6):S37–S50.

Microvascular complications of T2D

Microvascular complications
Damage to **small blood vessels** caused by severe and prolonged hyperglycaemia

Diabetic retinopathy

~25%

of patients with T2D have retinopathy and the risk increases over time[1]

Chronic kidney disease

~7%

of patients with T2D already have **microalbuminuria** at the time of diagnosis[2]

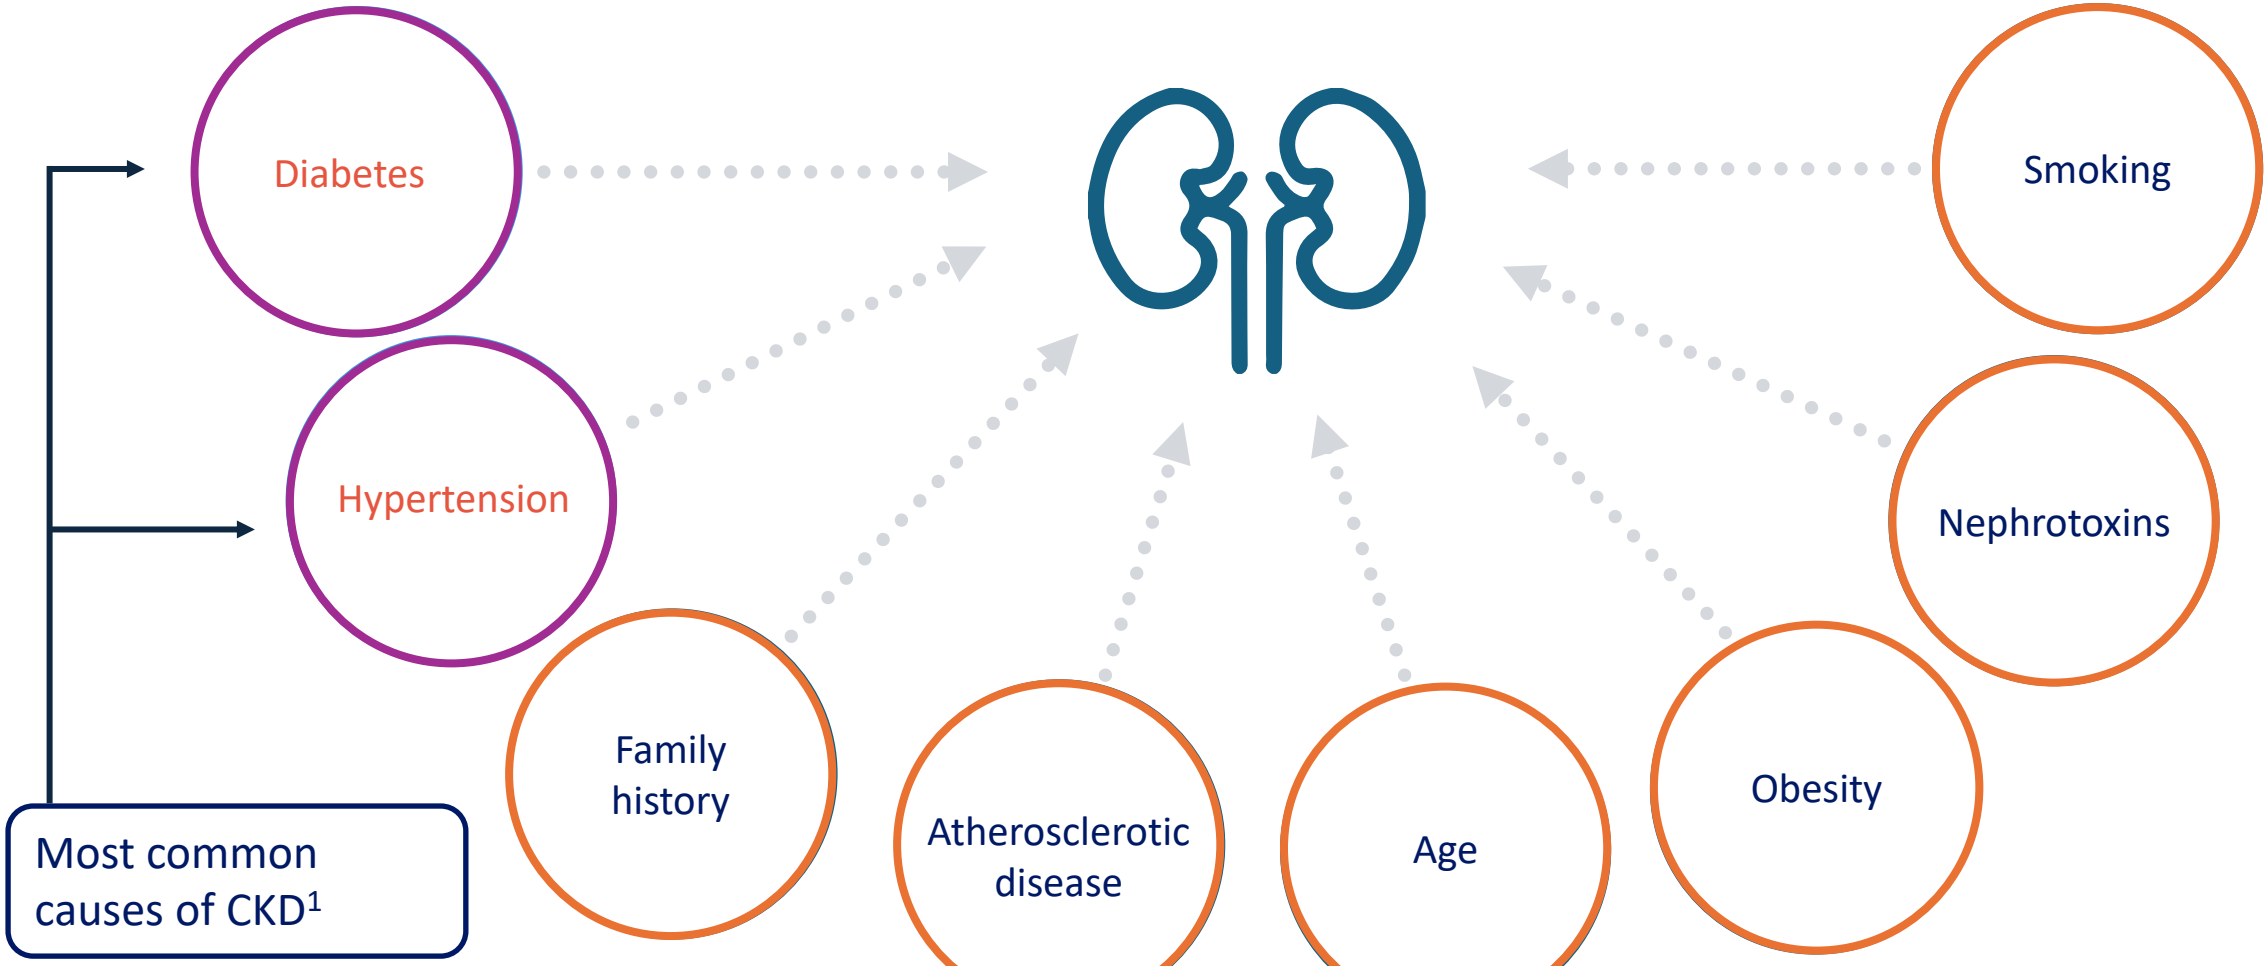
Diabetic neuropathy

45%

incidence of neuropathy for patients with T2D[3]

1. Yau JWY et al. *Diabetes Care* 2012;35:556–564; 2. Gross JL et al. *Diabetes Care* 2005;28:164–176; 3. Russell KW, Zilliox LA. *Continuum (Minneap Minn)* 2014;20:1226–1240

CKD risk factors and causes

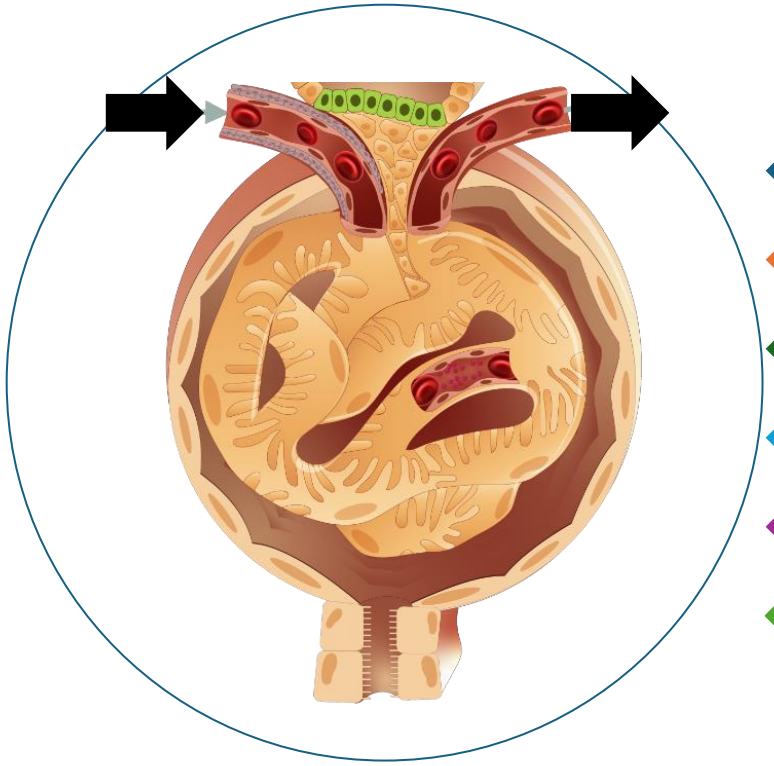


CKD, chronic kidney disease

1. NIDDK. Available from: Causes of Chronic Kidney Disease | NIDDK (nih.gov) accessed May 2021; 2. Kazancioğlu R. Kidney Int Suppl (2011) 2013; 3(4):368–371; 3. Woolfson R. Postgrad Med J 2001; 77(904):68–74; 4. Hall ME et al. Int J Nephrol Renovasc Dis 2014; 7:75–88; 5. Orr SE et al. Int J Mol Sci 2017; 18:pii: E1039

Kidney hyperfiltration is a common feature and driver of disease progression across the diverse CKD etiologies

Diabetes and hypertension are responsible for **more than half** of all cases of CKD[1]



- **Diabetic nephropathy[2]**
- **Hypertensive nephrosclerosis[3]**
- **IgA nephropathy[4]**
- **Focal segmental glomerulosclerosis[5]**
- **Obesity[2]**
- **Polycystic kidney disease[2]**

CKD = chronic kidney disease; IgA = immunoglobulin A.

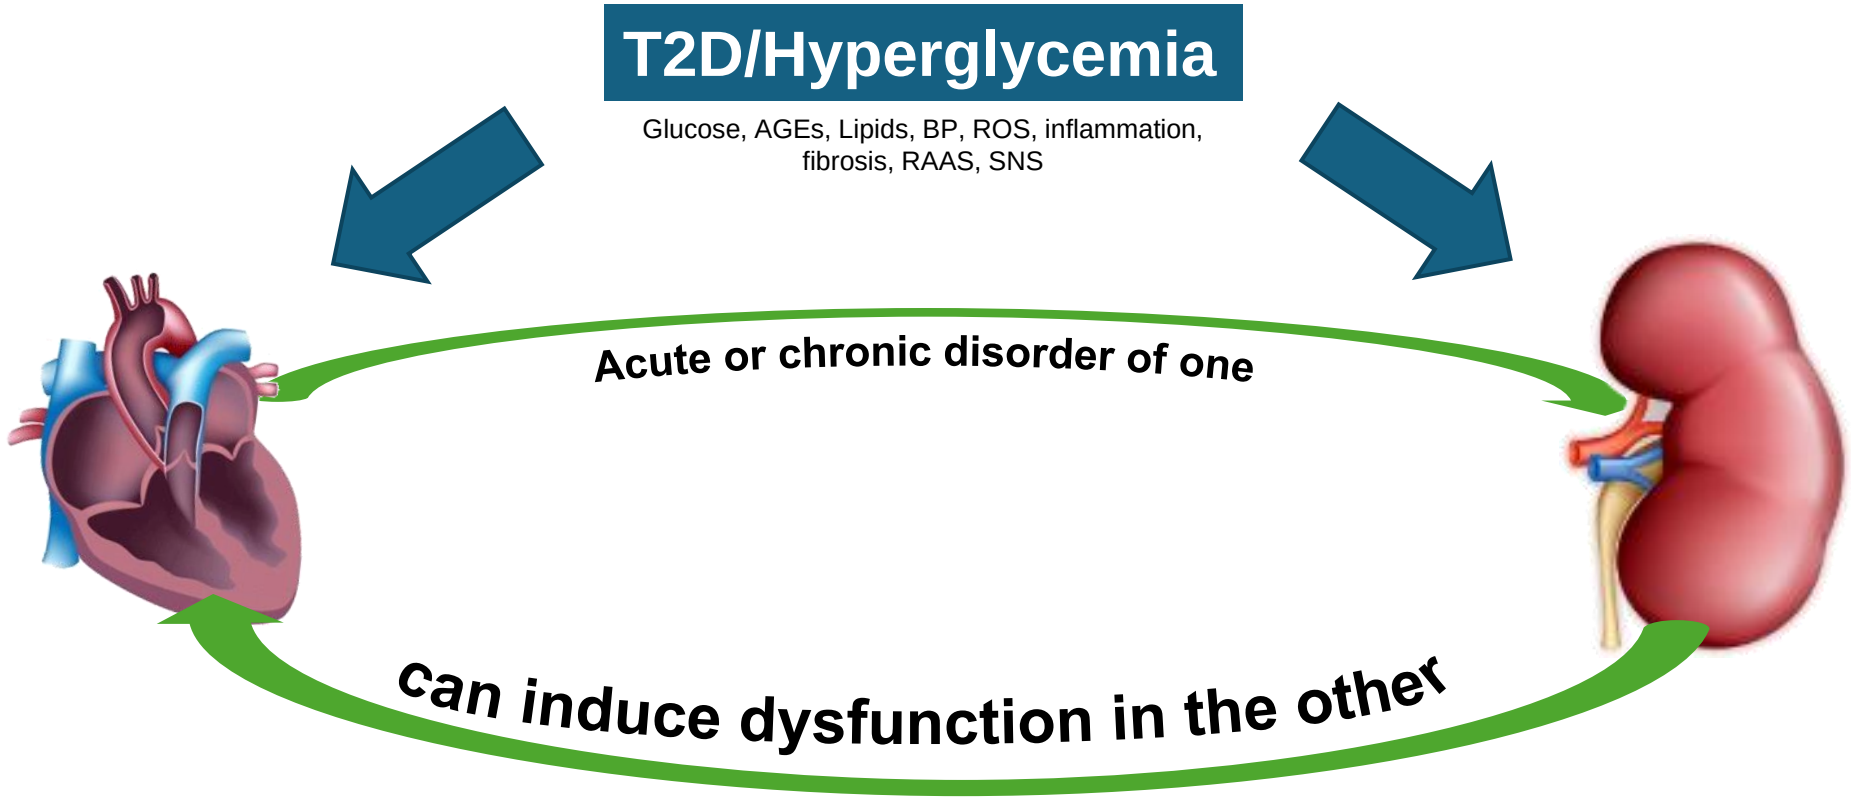
Type 2 diabetes, cardiovascular and renal disease are closely interconnected



Renal and cardiac systems are inextricably linked and should be considered together

AGEs = advanced glycation end-products; BP = blood pressure; RAAS = renin angiotensin aldosterone system; ROS = reactive oxygen species; SNS = sympathetic nervous system; T2D = type 2 diabetes.

1. Maqbool M et al. *Semin Nephrol.* 2018;38:217-232; 2. Ronco C et al. *J Am Coll Cardiol.* 2008;52:1527-39.

Early and effective control can reduce complication risks

Treating additional risk factors further reduces risks or microvascular and macrovascular complications

- Tight glucose control early in the course of T2D can reduce long-term CV outcomes
- HbA_{1c} <7% is associated with lower risk of microvascular events
- International practice guidelines encourage early glucose lowering to achieve near-normal HbA_{1c} targets

HbA_{1c}, glycosylated haemoglobin; T2D, type 2 diabetes.

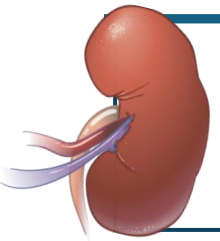
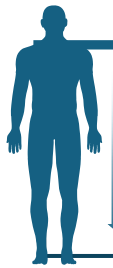
ISGLT 2

Evidence Supports Glycemic and Non-glycemic Effects of SGLT-2i

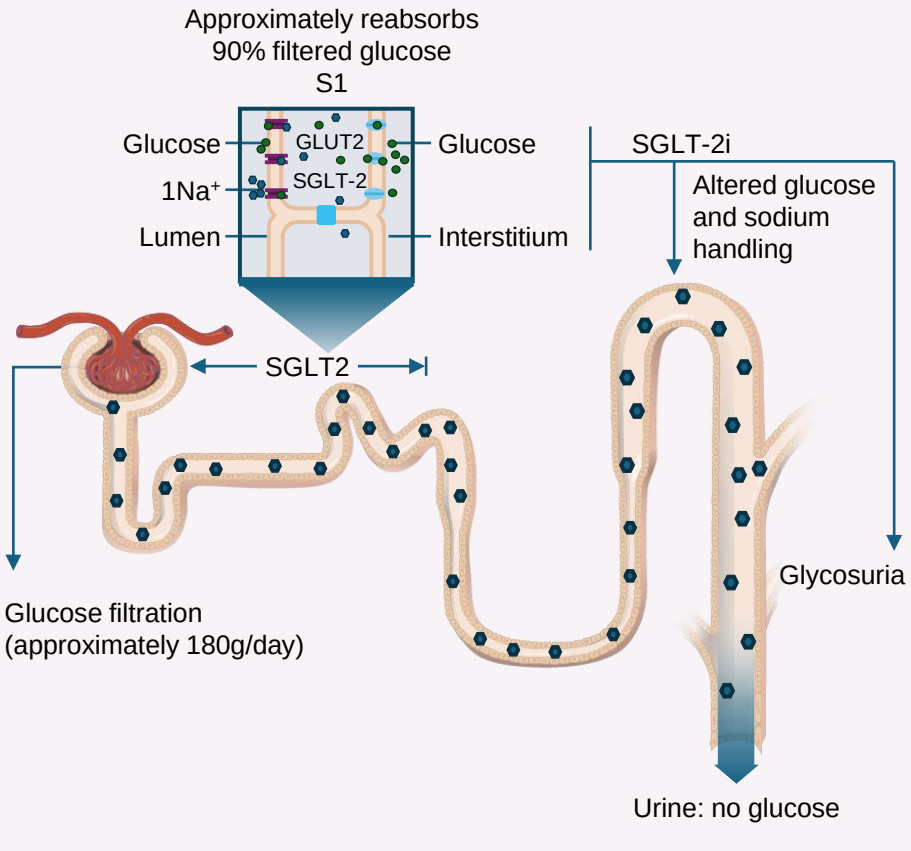


- Decreased glucose and sodium reabsorption[1,2]
- Increased delivery of sodium to the distal tubule[1]

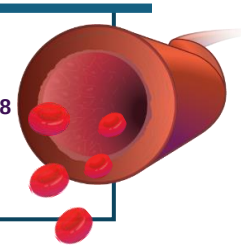
- Decreased plasma glucose[3,4]
- Increased β-cell function[3,4]



- Decreased body weight[5,6]
- Decreased fat mass[5,6]
- Increased insulin sensitivity[7]



- Decreased blood pressure[7]
- Decreased plasma volume[6,8]
- Increased hematocrit[6]



- Decreased preload and afterload[6]
- Increased cardiac efficiency[9,10]
- Decreased cardiac remodeling[10,11]

Potential mechanisms by which SGLT-2 inhibition reduces risk for heart failure hospitalization are not fully understood and research is under way

Dapagliflozin is not indicated for weight loss or hypertension.

2023 KDIGO CKD Guideline: SGLT2 Inhibitors in CKD

Preview Presented at 2023 ERA Congress[1]

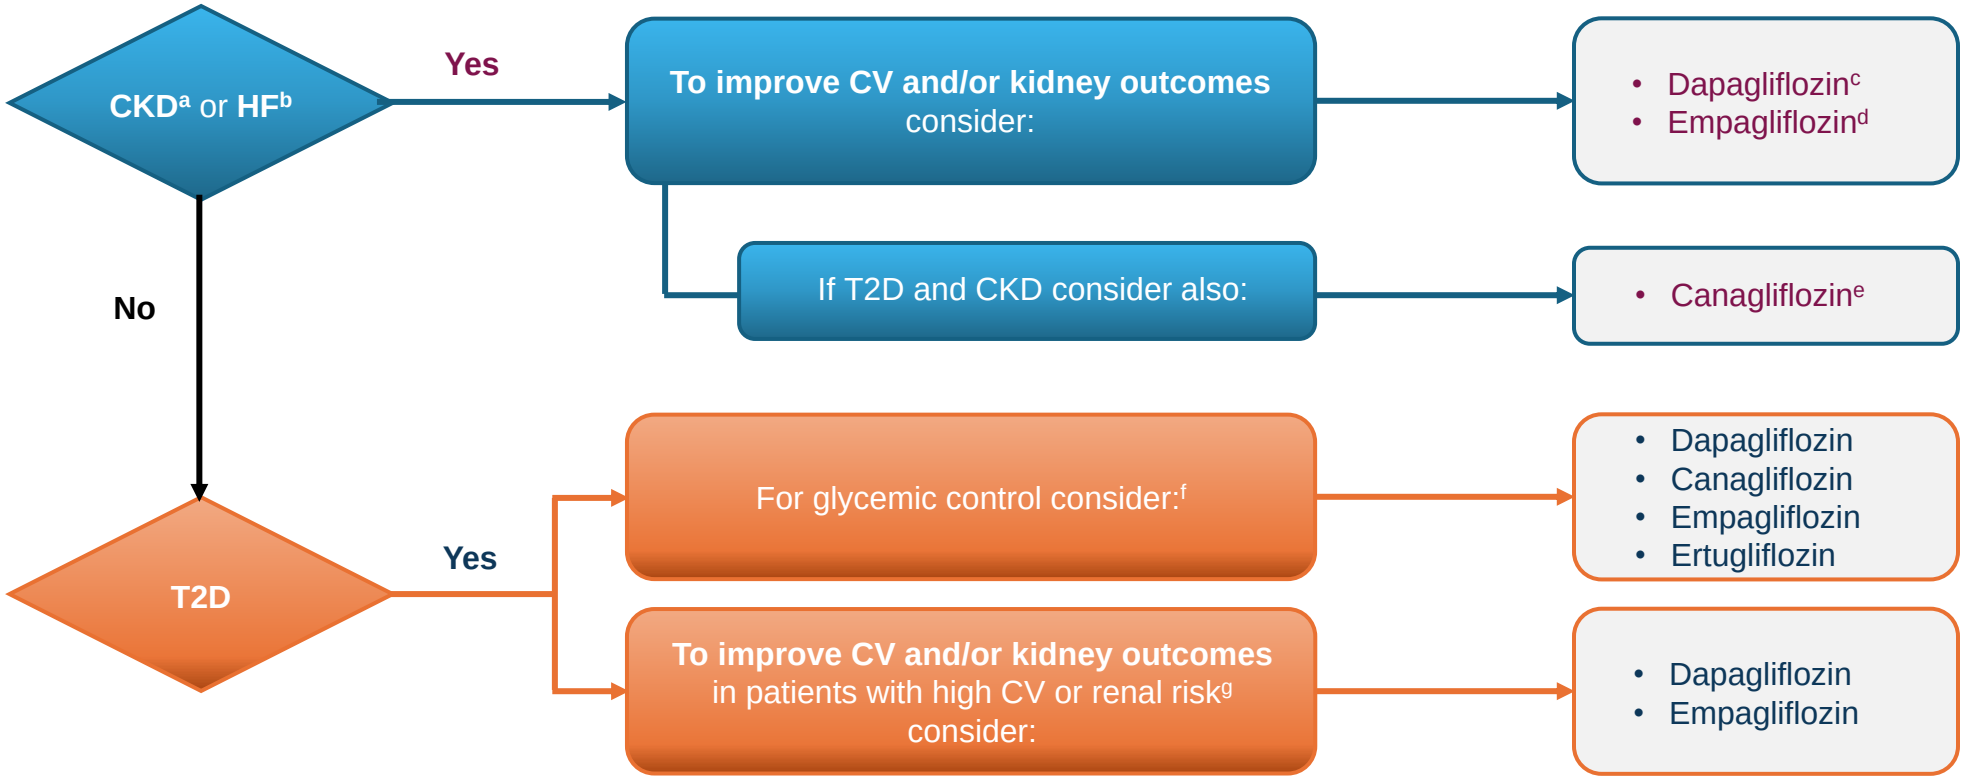
- **Recommendation 3.6.1:** We recommend treating adults with CKD and heart failure or eGFR ≥20 mL/min/1.73 m^2 with UACR ≥200 mg/g with an SGLT2 inhibitor (1A)
- **Recommendation 3.6.2:** We suggest treating adults with eGFR ≥20-45 mL/min/1.73 m^2 with UACR <200 mg/g with an SGLT2 inhibitor (2B)

Note: Level 1 = "We recommend" and Grade A = High quality of evidence; Level 2 = "We suggest" and Grade B = Moderate quality of evidence.[2]

CKD = chronic kidney disease; eGFR = estimated glomerular filtration rate; ERA = European Renal Association; KDIGO = Kidney Disease: Improving Global Outcomes; SGLT2 = sodium-glucose cotransporter 2; UACR = urine albumin-to-creatinine ratio.

1. Madero M. Presented at: 60th ERA Congress; June 15-18, 2023; Milan, Italy and Virtual; 2. KDIGO. KDIGO methods manual for guideline development – December 2022.

2023 ERA Consensus Paper: Algorithm for Selection of SGLT2i in Patients With CKD, HF, or T2D



[a]eGFR <60 mL/min/1.73 m^2 or UACR >30 mg/g; [b]With reduced or preserved ejection fraction; [c]Start if eGFR ≥25 mL/min/1.73 m^2 and continue until start of KRT; [d]Start if eGFR ≥20 mL/min/1.73 m^2; [e]Start if eGFR ≥30 mL/min/1.73 m^2 and continue until start of KRT; [f]While all 4 drugs may be used for glycemic control with eGFR ≥45 mL/min/1.73 m^2, an SGLT2i that has improved outcomes in CKD randomized controlled trials would be preferable if eGFR is 45-60 mL/min/1.73 m^2; [g]Established atherosclerotic CV disease (coronary, peripheral vascular, or cerebral artery disease).

GLP-1 receptor agonists and cardiorenal outcomes in type 2 diabetes: an updated meta-analysis of eight CVOTs

Dario Giugliano[1,2*†], Lorenzo Scappaticcio[1,2†], Miriam Longo[1,2†], Paola Caruso[1,2], Maria Ida Maiorino[3], Giuseppe Bellastella[1], Antonio Ceriello[4], Paolo Chiodini[5] and Katherine Esposito[2,3]

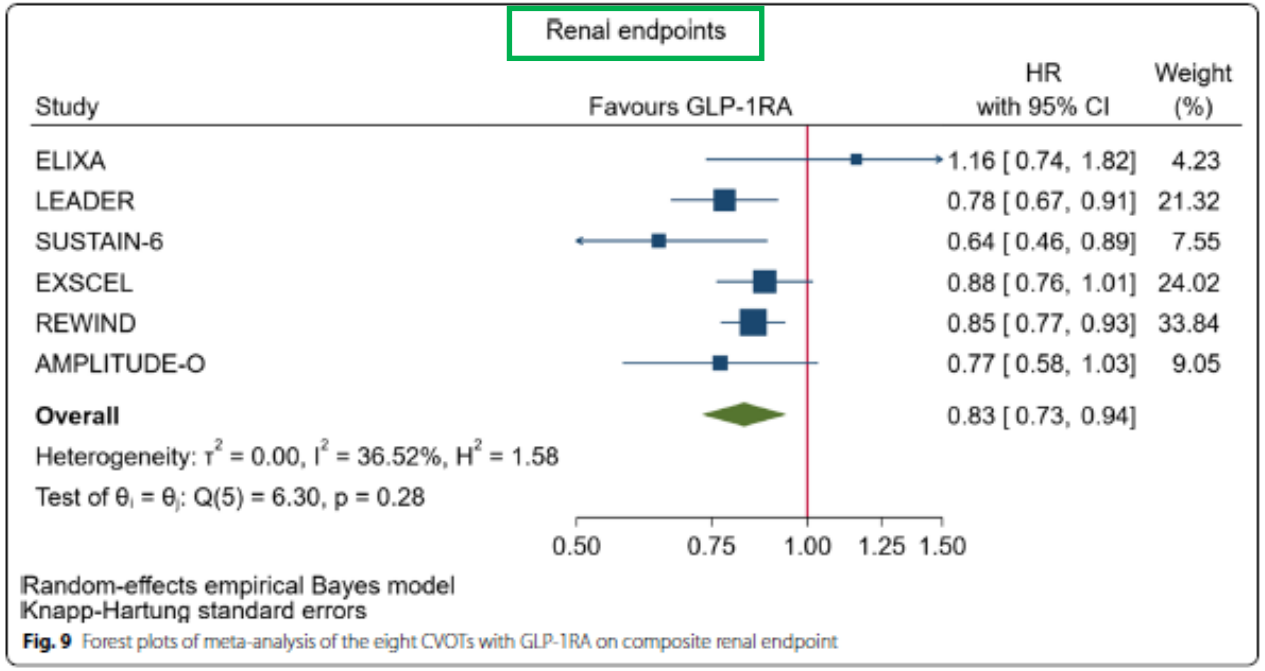

Fig. 9 Forest plots of meta-analysis of the eight CVOTs with GLP-1RA on composite renal endpoint

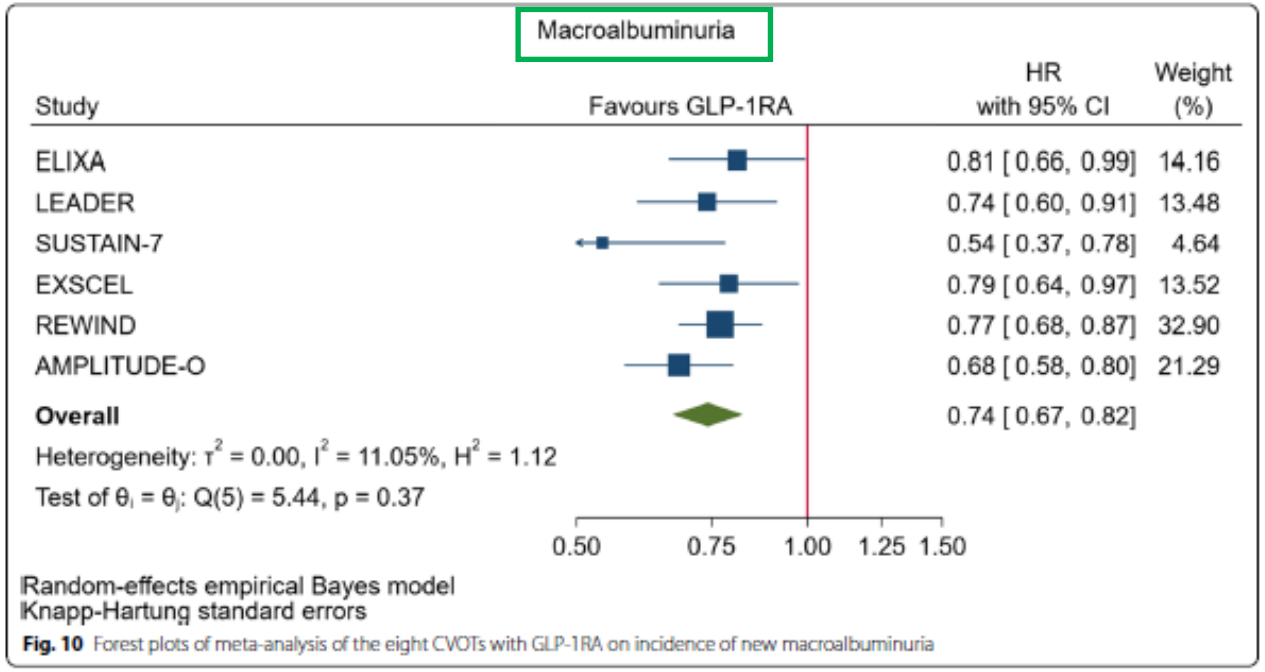

Fig. 10 Forest plots of meta-analysis of the eight CVOTs with GLP-1RA on incidence of new macroalbuminuria

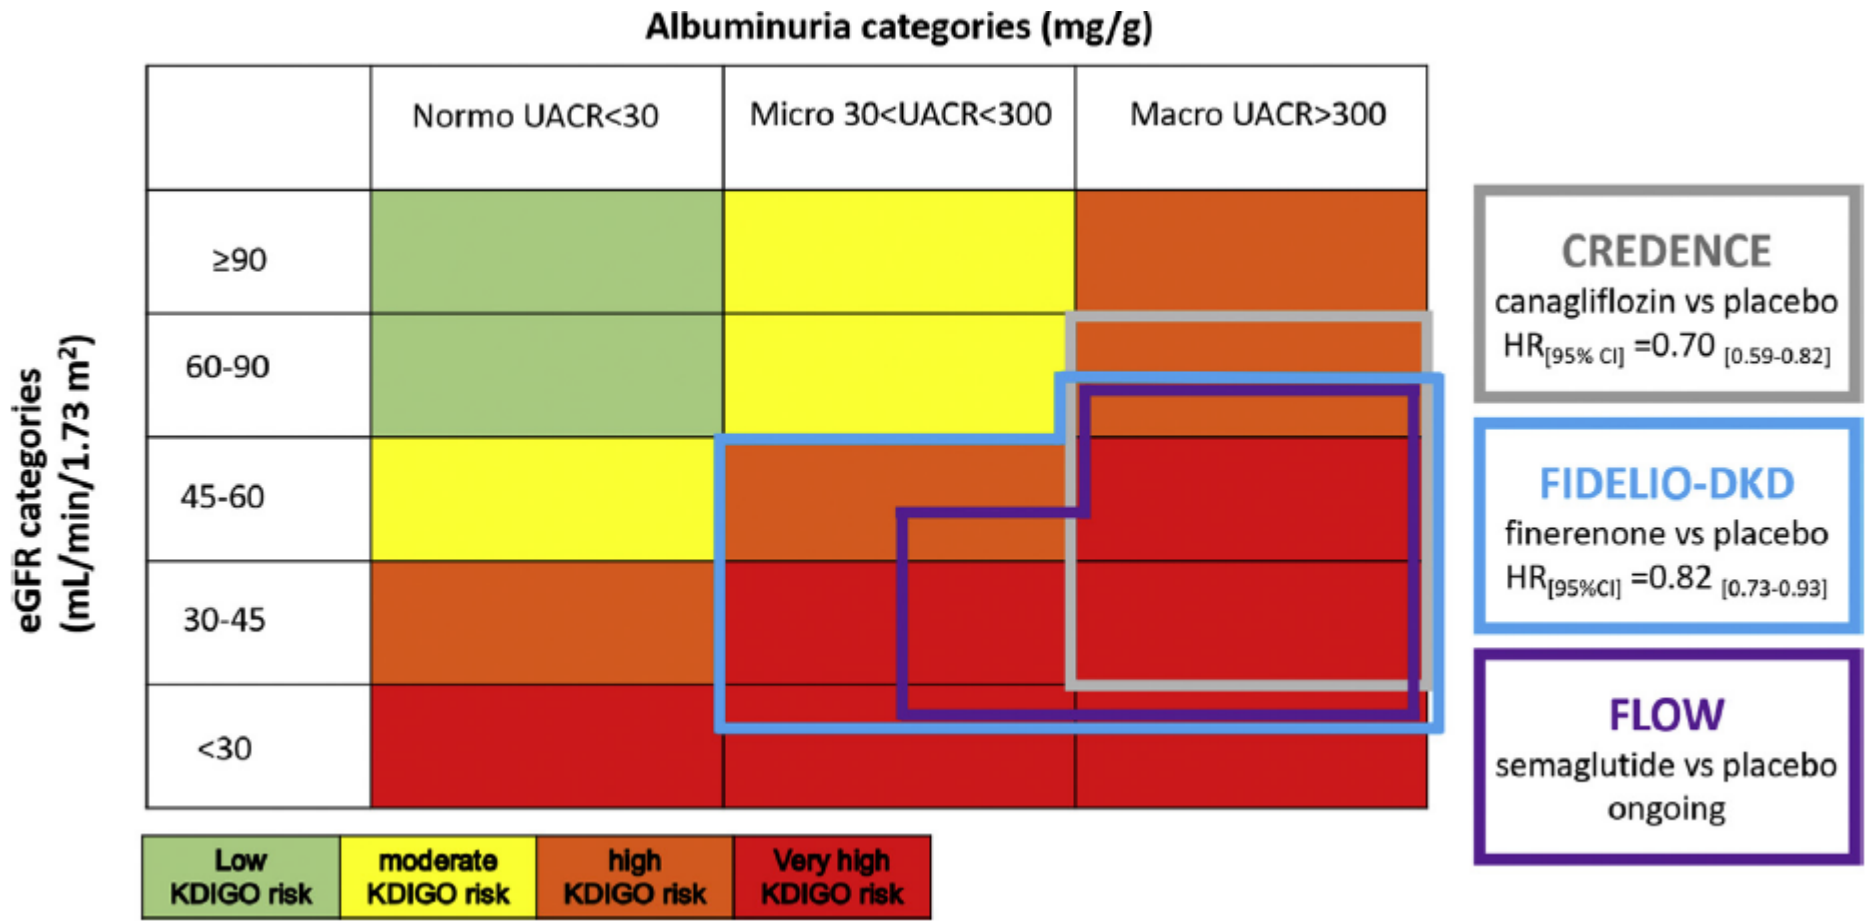
Kidney Outcomes With Glucagon-Like Peptide-1 Receptor Agonists in Patients With Type 2 Diabetes

Ofri Mosenzon,[1] Meir Schechter,[1] and Gil Leibowitz



Summary of the 2023 ADA Standards of Care in Diabetes

- The choice of pharmacologic agents should be guided by a person-centered approach including comorbidities and treatment goals.
- In adults with T2D and **HF, CKD, and/or established/high risk of ASCVD**, the treatment regimen should **include agents that reduce cardiorenal risk** independent of background use of metformin or baseline HbA1c.

Recommended Therapy	T2D Population	Rationale
SGLT2 inhibitor[a]	**HF** Current/prior HF symptoms with reduced or preserved EF	Reduce the risk of worsening HF and CV death, improve symptoms, physical limitations, and quality of life
	CKD[b] eGFR <60 mL/min/1.73 m^2 OR urinary albumin ≥30 mg/g creatinine	Reduce CKD progression and CV events
	Established ASCVD, multiple ASCVD risk factors, or CKD	Reduce the risk of MACE and/or hHF
GLP-1 RA[c]	**CKD** (if SGLT2 inhibitor not tolerated) eGFR <60 mL/min/1.73 m^2 OR urinary albumin ≥30 mg/g creatinine	Reduce the risk of CV events
	Established ASCVD or multiple ASCVD risk factors	Reduce the risk of MACE

[a]Use agent with proven benefit in HF population, agent with evidence of reducing CKD progression in CKD population, and agent with proven CV disease benefit in patients with established ASCVD/multiple ASCVD risk factors/CKD; [b]Recommended for use in patients with eGFR ≥20 mL/min/1.73 m^2 and urinary albumin ≥200 mg/g creatinine (Level of evidence A). Recommended for use in patients with eGFR ≥20 mL/min/1.73 m^2 and urinary albumin ranging from normal to 200 mg/g creatinine (Level of evidence B); [c]Use agent with demonstrated CV benefit in those with established ASCVD or multiple risk factors for ASCVD.

ADA = American Diabetes Association; ASCVD = atherosclerotic cardiovascular disease; CKD = chronic kidney disease; CV = cardiovascular; EF = ejection fraction; eGFR = estimated glomerular filtration rate; GLP-1 RA = glucagon-like peptide-1 receptor agonist; HbA1c = glycated hemoglobin; HF = heart failure; hHF = heart failure hospitalization; MACE = major adverse cardiovascular event; SGLT2 = sodium-glucose cotransporter 2; T2D = type 2 diabetes.

#Expert Consensus ottenuta con metodo Delphi in un Panel di 80 Diabetologi italiani con solida esperienza clinica nel campo del diabete.
Lo statement citato (n. 24) ha ottenuto un livello di agreement del 76%, in accordo con la letteratura che dimostra le proprietà anti-aterosclerotiche dei GLP-1RA.

GLP1RA, agonista del recettore del peptide 1 simile al glucagone; MACE, eventi cardiaci avversi maggiori; SGLT2i, inibitore del cotrasportatore sodio-glucosio 2.
